CLARKSON UNIVERSITY NON-DISCRIMINATION POLICY

Clarkson University does not discriminate on the basis of race, color, creed, religion, sex, sexual orientation, gender identity, gender expression, national or ethnic origin, age, disability, military or veteran status, predisposing genetic characteristics, domestic violence victim status, familial status, marital status, parental status, ancestry, source of income, or other classes protected by law in provision of educational opportunity or employment opportunities.

Clarkson University does not discriminate on the basis of sex or disability in its educational programs and activities, pursuant to the requirements of Title IX of the Educational Amendments of 1972, and Section 504 of the Rehabilitation Act of 1973, and the American Disabilities Act of 1990 respectively. This policy extends to both employment by and admission to the University.

Inquiries concerning Section 504, and the Americans with Disabilities Act of 1990 should be directed to ADA504@clarkson.edu.

Inquiries concerning the Age Discrimination Act, or other discrimination concerns should be directed to the Chief Human Resources Officer/Affirmative Action Officer at (315) 268-3788, Room 102 Graham Hall, Clarkson University, Box 5542, Potsdam NY 13699-5542 and/or Title IX to the Title IX Coordinator, Room 1003a ERC, Clarkson University, Box 5750, Potsdam, NY 13699-5750; or telephone (315) 268-4208, titleix@clarkson.edu.

Information on the processing of grievances and charges relating to the above policies can be obtained from the Human Resources/ Affirmative Action Office.

Clarkson University is making a special effort to identify for employment opportunities and participation in its educational programs a broad spectrum of candidates including women, minorities, and people with disabilities.

Financial and Managerial Accounting for Decision Making [Cross-listed with AC 603] This course covers Financial and Managerial Accounting concepts for MBA students. The financial accounting portion; covers the fundamentals of the accounting cycle and the evaluation of the major financial statements for external reporting purpose. Furthermore, develop the ability to analyze the financial statements. The managerial cost accounting portion will cover job costing, process costing, cost-volume-profit analysis, budgeting and pro-forma financial statement development, flexible budgets and standard costing systems, cost allocation and responsibility accounting, and tools for short-term business decisions. The overall objective of the course is to develop students' ability to construct accounting reports, understand accounting reports and make decisions from such accounting information. Fraud and Forensic Accounting

[Formerly MBA 610] This MBA course is designed as a seminar. The primary goal of this course is to assist students in recognizing fraud, which will aid in the prevention and detection of fraud. This course will focus on the professional responsibility of accountants to act ethically. The course materials will discuss what a fraud is, how frauds can be committed, how frauds can be uncovered, and what accountants and business executives can do to prevent frauds from occurring in their organizations. We will use a variety of materials that were provided by the Association of Certified Fraud Examiners. In addition, students will analyze fraud case studies.

Components: Lecture Attributes: Offered Spring Term

AC 613(3) 2016-07-25 Course TD:012544 Advanced Auditing and Research

[Formerly MBA 613] This course is an advanced case and research-oriented study of topics in Auditing. Through a series of cases and related research, students will engage in the practice of auditing using real-world situations as the foundation for technical and theoretical discussions of issues facing the contemporary auditor. Cases will be chosen to reflect current and emerging topics in the practice of public accounting, financial auditing, fraud investigation, and forensic accounting. Auditing communications tools and software-based audit techniques will also be emphasized.

AC 620(3) Course ID:013020 2019-11-01

Accounting Analytics Understanding how to use data to formulate and solve business problems provides an opportunity for the accounting professional to become a forward-thinking strategic partner in the organization. This course is designed to prepare students with the necessary tools and skills needed to perform data analytics successfully. Based on case studies, students are required to think through the steps needed to provide data-driven insights and recommendations. Labs provide multiple datasets and tutorials. Students will conduct data analysis using Excel and Access (including SQL). The course will develop a student's data analytics mindset (critical thinking skills), that is the development of students' ability to ask questions that can be answered using data.

Components:	Lecture

AC 623(3) Course ID:007337 2021-11-18

Financial Statement Analysis This course helps students utilize the information contained in financial statements to make decisions. It specifically discusses (1) institutional forces underlying the provision of financial statement data, (2)

specifically discusses (1) institutional forces underlying the provision of financial statement data, (2) properties of numbers derived from financial statements, (3) key aspects of decisions using financial statement information and the environment in which they are made, (4) design of information appropriate to these decisions. The objective is to allow the student to employ these factors to exploit fully the richness of the information contained in financial statements, while appreciating its limits.

Components: Lecture Attributes: Given When Needed

Cost Management

AC 630(2)

A graduate level course covering basic concepts and techniques of cost management. Topics include basic cost management concepts, cost-volume-profit analysis, strategy and the master budget, the role of costs in pricing decisions, job and activity based costing (ABC) costing systems, relevant costs for decision making, operational and management control systems, target costing, value engineering, theory of constraints, the Balanced Scorecard, and the management and control of quality. Explores the analysis and presentation of information from a behavioral as well as a quantitative perspective. Introduces basic financial and sustainability concepts and reporting issues.

AE 342(3) Course ID:012886 Introduction to Numerical Methods with Application

2021-10-13

The goal of this course is to introduce the techniques needed for the numerical solution of ordinary and partial differential equations. These techniques will include the formulation of physical problems for numerical simulations, discretization and solution methods, and use of commercial software for solving engineering problems governed by differential equations. Specific topics covered are numberical differentiation, integration, interpolation, and associated errors, the solution of systems of non-linear algebraic equations, and the solution of initial and boundary value problems using finite difference and finite element methods.

Engineering - Mechanical & Aerospace Eng - Subject: Aeronautical Engineering

2017-02-24 AE 455(3) Course ID:007363 Mechanical Vibrations and Control [Cross-listed with ME 455] Fundamentals, free vibration, harmonically excited vibration, transient vibration, multi-degree freedom systems, vibration measurements, introduction to control theory, linear feedback control, vibration control, adaptive and optimal control, numerical methods. Components: Lecture Course Equivalents: ME 455 Attributes: Offered Fall Term Requirement Group: Prerequisites: ES223 Req. Designation: Technology Course ID:007364 2017-02-24 AE 457(3) Composite Mechanics and Design [Cross-listed with ME 457, CE 421] Nature of composite materials. Classification and characteristics of composite materials, mechanical behavior of composite materials. Macromechanical and micromechanical elastic behavior of unidirectional lamina. Constitutive and transformation relations. Strength of unidirectional lamina. Composite failure theory. Mechanics of multidirectional structural laminates. Lamination theory. Strength and failure analysis of multidirectional laminates. Effect of temperature and moisture. Lecture Components: Course Equivalents: ME 457 Attributes: Offered Spring Term Requirement Group: Prerequisites: ES222 and ES260 Req. Designation: Technology AE 458(3) Course ID:007365 2017-07-06 Design of Aircraft Structures Properties of fuselage sections; modified beam theory for fuselage design; linear elastic plate theory and analyses; linear elastic shell theory and analyses; numerical techniques for complex structures; failure modes of plates and shells; introduction to composite materials; design techniques for plates and shells Components: Lecture Attributes: Offered Spring Term Requirement Group: Prerequisites: AE350. Req. Designation: Technology AE 459(3) Course ID:013129 2021-10-11 Space Robotics This course establishes principles underpinning space robotics with a thorough and modern approach; chapters build from general physical foundations through an extensive treatment of control systems, perception challenges, and conservation principles in dynamics. After introducing the principles and governing dynamic equations of space robotic systems, the latter part of the course focuses on real-life applications related to space systems including space mechanics and the dynamics of space vehicles. It introduces supervised and unsupervised machine learning (ML) algorithms including implementations of ML techniques for perception challenges that can be applied to a wide range of space vehicles and robotic systems. Applications of dynamics and control theory to real spacecraft systems are also covered. After completing this course, the students will be able to apply basic robotic and machine learning techniques in space robotic systems. Components: Lecture Course Equivalents: ME 559 Offered Spring Term Attributes: Req. Designation: Technology AE 460(3) Course ID:012922 2019-01-14 Introduction to Spacecraft Engineering One-semester elective course offered to Juniors and Seniors in the ME or AE programs. Introduces the major

engineering subsystems and disciplines required to design and operate a space satellite e.g. configuration and structure, electrical power subsystem, attitude control subsystem etc. Also basic orbital mechanics, launch vehicles, space environment including ionizing radiation and Sun-Earth-spacecraft geometries, ground operations; overall mission and spacecraft system engineering.

[Formerly LC393] Over the last few decades, manhood has come under attack. Instead of warrior heroes like John Wayne and James Bond, TV shows today feature a good number of losers like Homer Simpson and Frazier and numerous men's movements have emerged centered on such issues as 'male bonding' and atonement. At the same time, other aspects of popular culture bombard us with an image of men as muscle-packed, mean, lean fighting machines or as exploitative pimps. While the average size of men's muscles seemed to have increased dramatically, what has happened to men's sense of self, how they see each other, and how they see women? Is this all the result of feminists attacking men as being domineering, oppressive chauvinists? Or is this a period of sorely needed male self-reflection? In this discussion-based course we take a critical look at the role of manhood in our society and elsewhere, by looking at how it is represented in popular culture, and lived in such institutions as sports, schools and college, military, prisons, marriage, politics or work, and

The Diversity of the U.S. in Ethnographic Perspective

The United States is often referred to as a 'melting pot' of cultures. This metaphor is said to represent the ways in which people of diverse racial and ethnic backgrounds make up the American nation. As components of diversity in the U.S., race and ethnicity are understood in varied ways. Racial and ethnic conflict, clashes, disparities, and inequalities sometimes manifest themselves across professions, housing, access to opportunities, and livelihoods in general. But a closer look can unveil the remarkably creative ways in which different groups of people establish meaningful connections to bridge differences, allowing productive syntheses to emerge in social, cultural, political, religious, and economic realms. This course offers a window into some of these clashes and collaborations through engaging readings and audiovisual materials putting U.S. diversity into context. Anthropologists and other social scientists usually call such a window an ethnographic one. In other words, the course will help you put diversity into perspective by bringing you

ANTH 255(3)

Culture and the Environment

[Cross-listed with ANTH555] As our world faces ever-more urgent challenges related to climate change and environmental instability, the very categories of "nature," "environment," and "climate" deserve critical and innovative thought. Central to this rethinking is a consideration of the cultural, political, and economic aspects of these terms, thereby creating space for careful critiques and alternative engagements. Anthropologists have long been active in examining cultural beliefs and practices related to environments. Today, these perspectives are changing to reflect a better understanding of human relationships with non-human actors and processes. This class provides an introduction to Environmental Anthropology, with particular attention to the power and politics of knowledge production about environments and climates. It begins with a historical look at the sub-discipline, followed by a discussion of more recent theoretical and methodological approaches to rethinking how we study and engage with the environment.

ANTH 311(3) Course ID:012843 2020-01-15

[Cross-listed with ANTH511] Ethnographic methods, the key research methodology of cultural anthropologists, are now used in a wide variety of disciplines, such as education, to health, environment, business, to name just a few. An exploration of anthropological research and writing through the analytical and practical study of "fieldwork" and "ethnography", this course examines a variety of anthropological research methods and genres of representation, and teaches students how to conduct an ethnographic fieldwork project of their own. This course is in large part a workshop in which students will learn and mobilize various ethnographic methods and techniques, identify a research project and conduct ethnographic fieldwork. The culminating experience of the course is the writing of a 10-15 pages mini ethnography, based on the fieldnotes that students are writing.

Racial Inequality in the United States

Course ID:010455 2020-09-22

[Formerly LC356] What is the status of racial equality today, four decades after the civil rights struggle? Have we ceased to judge people 'by the color of their skin,' have we achieved a society where all members share 'equal opportunities' to succeed? Has the 'appreciation of cultural diversity' in America abolished notions of white superiority and practices of white privilege? Or have we returned, albeit in a more invisible form, to the hypocrisy of the 1896 Apartheid doctrine of 'separate but equal'? Or, is racism permanent and racial inequality a critical element in the fabric of American society? This course attempts to arrive at an understanding of how systems of racial inequality are maintained in a seemingly democratic system that allegedly upholds the civil rights of all its citizens. We will first assess the extent of racial inequality. Facing the paradox of explaining the social reality of race while asserting its biological

ANTH 325(3) Sex and Commerce

This course, designed for upper division students who have been taking courses on sexuality and/or gender, examines in depth the commercial aspects of sex. From looking at the concept of marriage as an economic transaction, to the ways in which sex is sold or is used as a vehicle to sell, this course provides an in depth discussion of the question of pornography, sex-trafficking, and prostitution. It raises fundamental questions about sexuality, love, and gender.

ANTH 332(3)

Cities and Social Justice

[Formerly LP310] Understanding Cities: New York, Los Angeles, Berlin. For many Americans, cities have become synonymous with violence, poverty and decay, homelessness and racial tension, as well as excessive consumerism. But they are also places of intense cultural activities. In any case, cities are where most jobs are concentrated and where most of us will eventually live. Understanding how cities work and the problems they face is therefore critical for all of us. Using a comparative and international perspective, this course explores such issues as cities' management of natural and vital resources (f.ex. water or electricity), the built environment and its relationship to social identities and social engineering, global networks of cities in terms of labor markets, capital, and commodities, and their effects on urban lives, cities as sustainable environments, and last but not least, the cities as sites of social and racial in/justice. Students are to conduct team-based research projects that tackle real-life problems in one of the three cities or Potsdam

BIE 400(3) Course ID:012903 2018-10-23

This course is designed to provide students with an introduction to the ethics of scientific research, including research involving human participants and animal subjects. The course will start with a discussion of responsible conduct of research (also known as research integrity and commonly referred to by the acronym RCR). As close to ninety percent of the work that research ethicists do focuses on the education, promotion and adjudication of RCR issues, these issues are applicable to all aspects of the research endeavor and all fields of scientific study. Understanding these issues and being able to apply the basic principles to critically analyze cases is thus an essential starting point for anyone interested in research and research ethics. The course will also delve briefly into some of the basic ethical, legal, and social issues surrounding research using animal subjects or human volunteers.

Research Ethics

This course is designed to teach students about the ethics of scientific research, particularly research involving human participants. Upon completion of the course, students should be able to: (a) discuss in depth the principles of bioethics and how these principles should be applied to the ethical design and conduct of research involving human participants or animal subjects; (b) identify, define, and analyze ethical issues in the context of novel and potentially problematic areas of scientific research; (c) identify, through case studies, ethical issues that arise in different contexts and begin to reason through an appropriate course of action. In addition, students will be taught basic practical skills in research, writing and reviewing articles, and providing training and education in bioethics.

BIE 570(3)

Bioethics Policy: Foundations

This course will address prospective rules designed to govern populations, as opposed to the individual patient-provider encounter or ethics review of scientific research protocols. Often, bioethics policies have the force of law (e.g., statute, agency regulation, court precedent); at other times, they are voluntarily adopted by institutions or groups (e.g., hospitals, insurers, IRBs, research funders, the AMA). In this course, we will focus on the moral philosophical and behavioral foundations of contemporary bioethics policy, drawing on concepts from philosophy, economics, and psychology that are increasingly used in domestic and international policymaking.

Research Ethics II

Clarkson University

Course Catalog

Run Date: 06/27/2022 Run Time: 14:02:09

School of Arts and Sciences - CRC Bioethics Program - Subject: Bioethics

2022-06-07 BIE 580(3) Course ID:012184

This course teaches students about the ethics and policies governing scientific research, particularly research involving human participants or animal subjects. This course builds upon the knowledge and themes introduced in BIE 555 (Research Ethics I). Research Ethics II covers these topics in greater depth and explores the key US and international laws and policies that regulate the design, conduct, and oversight of trials involving human participants or animal subjects. In addition, students examine in-depth specific areas or types of biomedical research that are potentially controversial or ethically problematic.

Components:	Lecture	
Attributes:	Offered Winter	Term
Requirement Group:	Prerequisites:	BIE555
Req. Designation:	Technology	

BIE 590(3) Course ID:012185 2022-06-07 Clinical Ethics

This course deals with the practical applications of clinical ethics, including clinical ethics consulting and its recording and documentation, the work of ethics committees and IRBs, and other practical aspects of clinical ethics.

Lecture Components: Attributes: Offered Fall Term

Req. Designation: Technology

BIE 610(3) Course ID:012187 2022-06-07

Online Practicum in Clinical Ethics

[Formerly BIE 610C] This course is designed to help students develop many of the competencies required to perform clinical ethics consultation (CEC) at a basic level. Upon completion of the course, students should be able to: (a) assess their own strengths and weaknesses with respect to CEC competencies; (b) apply a systematic method to analyze and document CEC cases; (c) practice techniques to help avoid common CEC quality gaps; and (d) recognize complex cases for which advanced-level CEC competencies are required. While the course emphasizes process skills for CEC, students will also gain experience that will augment their clinical ethics content knowledge, emotional intelligence, and critical thinking.

Practicum Components: Requirement Group: Prerequisites: BIE590 Req. Designation: Technology

BIE 611(3)

Course ID:012189 Online Practicum in Research Ethics

[Formerly BIE 610R] A supervised practical experience in research ethics designed to teach specific skills. Exposes students to the process of ethical review of research involving human volunteers or animal subjects, and helps students develop some of the basic skills that a working research ethics professional needs. Through online discussion and participatory exercises, students gain a practical understanding of: (a) research ethics committee structure and function, (b) applicable state and federal regulations regarding the conduct of research involving human volunteers or animal subjects, and (c) relevant organizational and management skills needed to lead a research ethics committee. In addition, students learn practical skills in qualitative and quantitative research, report and grant writing, and bioethical training and education.

2022-06-07

2022-06-07

Components: Practicum Offered Spring Term Attributes: Requirement Group: Prerequisites: BIE580 Req. Designation: Technology

BIE 612(3)

Online Practicum in Policy

[Formerly BIE 610P] This course is designed as an opportunity for students to develop and refine the skills of policy analysis that they have learned in prior courses - in particular, in the prerequisites to this course - and to apply them to a range of current issues in bioethics policy. The course covers a broad range of policy issues in the biosciences, including both public and institutional bioethics policies.

Course ID:012188

Components:	Practicum
Attributes:	Offered Spring Term
Req. Designation:	Technology

BIE 620(3) Course ID:012191 2016-07-25 On-Site Practicum in Clinical Ethics [Formerly BIE 620C] A supervised practical experience in clinical ethics designed to teach skills in clinical ethics consultation. Components: Practicum Attributes: Offered Spring Term Requirement Group: Prerequisites: BIE 590 Corequisites: BIE610 Req. Designation: Technology

Req. Designation:	Technology
BIE 673(3)	Course ID:012804 2017-06-23
	d Pedagogy (Spanish)
The purpose of this	online course is to provide students with basic skills in bioethics policy making and
pedagogy. The first	half of this course provides trainees with an understanding of the public policy making
	itical and regulatory environment in which researchers and research ethics committees
	d half of the course is designed to give trainees practical experience in teaching
	rch ethics to adult learners, covering such topics as theories of active learning,
	s, course planning and development, assessment and grading, and observation and feedback.

Institute for STEM Education - CRC Education Program - Subject: Educational Biology

BIO 580(3) Course ID:012225 2021-10-08 MAT Project in Biology (Content Area)

The MAT Project is a one-term research project whose purpose is to allow students time and supervision to develop breadth and/or depth of knowledge to become a better teacher in their certification field. What the project will entail varies greatly from student to student. The course is intended to be custom-tailored to meet the specific needs of an individual intern. MAT projects are well-grounded in research and theory, but also include a strong and extensive applied aspect, directly addressing the question: What would this look like in the classroom?

BOE 614(3) Course ID:012236 2016-08-27 Electric Power Industry Economics and Finance

This course will evaluate the weaving thread of economics and finance as an integral part of operations and strategic planning in the complex energy industry. It will investigate supplier economics and finance under regulation and deregulation environments. It will evaluate market transactions, payment paths, settlements, capital requirements, financial instruments, and procedures that are identified with the industry. It will review economic issues confronting power transmission owners/providers under regulated models and merchant function models. The course will identify and encourage a knowledge-based review of new technologies and green energy as they relate to financial and economic decision making. Energy policies, metering technology, micro-grids, government influences, fuels and storage will all be explored as they relate to various present and future economic and financial models.

BY 120(3) Course ID:009555 2015-11-16 Introduction to Biotechnology Sciences and their Applications Students in today's competitive market often need to possess multifaceted knowledge and skills. The interdisciplinary structure of BY120 encourages collaborations across schools and fields. The syllabus is designed to meet the needs and spark the interest of non-biology majors in biotechnology. By creating a stimulating, lecture-based, solid foundation in basic molecular biology and providing insight into the innovative discipline of biotechnology, students will be inspired and encouraged to apply their own academic backgrounds in a creative manner to drive innovations and applications in this field forward and to investigate possible employment niches for themselves. Aside from covering the fundamentals, the lectures will venture into bioinformatics, DNA amplification and sequencing technologies, genetic engineering and gene expression systems, large scale production, molecular diagnostics, personalized medicine, commercial products, gene therapy, stem cells, transgenic animals and plants, synthetic biology, patenting, as well as Components: Lecture Offered Spring Term Attributes: Req. Designation: Technology Course ID:010309 2015-01-23 BY 130(3) Contemporary Issues in Environmental Science This course examines how human activity impacts the environment. Topics include air and water pollution, environmental systems management, industrial ecology and environmental policy with emphasis on the multidimensional aspects of currently environmental issues. Case studies of chemical exposures, life cycle assessments, and integrated resources management will be used to discuss the process of environmental decision making. this has brought with it social benefits and environmental costs. The United States and Canada share the management of this resource and have shared notable success controlling environmental consequences of development yet are faced with emerging issues. The LGL/SLR system will be examined from a multidisciplinary, multinational perspective to illustrate that a shared resource can be maintained. Students will be able to understand the forces (geomorphic, biological, chemical, social, economic, and political) that have shaped and impacted a globally significant resource.

Course ID:007409 Behavioral Ecology and Sociobiology

[Cross-listed with PY 340] This course is concerned with the adaptive functions of animal behavior, emphasizing ecological and evolutionary perspectives. Topics covered include foraging behavior, sexual selection, social systems, parental care, and cooperation and conflict. One major focus will be on evaluating the arguments of proponents and critics of sociobiology on whether the field is useful at explaining human behavior. T

Comparative Vertebrat	e Anatomy		
This course compares	anatomical structures throughout of	different classes of ver	tebrates. We begin by defining
anatomical terms and	identifying what constitutes a ver	rtebrate. We will also l	earn how vertebrate organ
systems develop and t	the physical constraints placed on	development of these sy	stems. The anatomical study
will be broken down i	nto major organ systems that will	be discussed one at a t	ime. For each of the organ
systems, there will b	e a discussion of relevant structu	are and function followe	d a description of the major
changes in form and f	function throughout vertebrate evol	lution. Since there are	numerous classes of
vertebrates, we will	concentrate on representatives fro	om some of the better st	udies examples.

BY 352(2) Course ID:007412 2015-02-12

Through the use of dissection and histological observation, we will observe and make direct comparisons of anatomical structures from representative vertebrates. The organ systems that are dissected in this course will follow the topics presented in BY350. After the first two introductory labs, you will dissect specific organ systems one at a time in each of your specimens. This will allow you to make direct comparisons between comparable structures in different vertebrates. The animals that will be dissected (Necturus - Mud Puppy, Dogfish shark, pigeon, and cat) are representative vertebrates chosen to illustrate changes to the organ systems as vertebrates became more complex.

Human Cognitive Evolution

BY 357(3)

Comparative Vertebrate Anatomy Lab

[Cross-listed with PY 357] Evolutionary psychology is concerned with the adaptive problems and selective pressures our ancestors encountered in their environments, the psychological mechanisms that evolved to help them solve those problems, and the way those evolved mechanisms function in current environments. This way of thinking about the brain, mind, and behavior is changing how scientists approach old topics, and is opening up new ones. This course will focus on current developments and selected topics in evolutionary psychology (e.g., foraging, mate choice, parental investment, cooperation and culture) and explore the evolution of cognition from a broad comparative perspective.

Animal Learning and Cognition [Cross-listed with PY 358] This course focuses upon how animals acquire, process, store and recall information about their environment and social partners. Topics that will be examined include how animals perceive and classify stimuli; how they learn and remember; how they orient and navigate; how they measure time, number, and amount; how they acquire abstract concepts; how they perceive social relationships; and how they communicate. A diversity of invertebrate and vertebrate organisms will be included (sea slugs to primates!), and there will be an emphasis on understanding taxon-specific specializations as well as general patterns across animals. [Cross-listed with CM 406] Biomedical Analysis and Instrumentation is a lecture course designed to provide advanced undergraduates and graduate students in basic sciences, biosciences and bioengineering disciplines with scientific and engineering aspects of instrumentation, sample analysis, measuring and processing signals from living organisms. Functioning and calibration of biomedical transducers and devices actually used in clinical practice for analyzing clinical biomarkers for disease diagnostics will be reviewed. Emerging research in bioinstrumentation, biomedical technologies, stand alone and wearable sensing devices, analytical method development and validation will be also be covered. Special emphasis will be placed on measurement principles of medical instrumentation used in health technologies ranging from laboratory scale to next generation wearables. Training in professional ethics, grant writing, patenting, innovation, entrepreneurial activities and FDA regulation for new device development, laboratory management, as well as communication **Components:** Lecture

2019-09-25 BY 428(3) Course ID:012959 Kinesiology Knowledge of the correlates of structure and function is fundamental to the measurement and evaluation of human movement in movement science, health care professions, and product design. This course focuses on application of concepts of human movement to specific regions and joints of the human musculoskeletal system. Included are 1) application of the concepts of biological tissues and tissue mechanics in understanding non-pathological and pathological human movement of each joint and region, and 2) use of tools of measurement and evaluation in studying non-pathological and pathological human movement. Lecture Components: Attributes: Offered Even Springs Requirement Group: Prerequisites: BY471 and PH131 or PH141. Req. Designation: Technology BY 430(3) Course ID:007399 2017-01-13 Developmental Biology The course will focus on how an organism develops into a complex multicellular organism from a single cell. We will begin with the genetics of development and discuss mechanisms by which genes become sequentially activated as embryogensis proceeds. The mechanics and genetics of both invertebrate and vertebrate development will be discussed beginning with fertilization and ending as embryogensis is completed. We will also discuss some additional developmental events that occur during embryogensis and later in adults. Because of technological advances in developmental biology, topics in this field have also become important societal issues. Throughout the semester, we discuss the ethical implications of using these advances and their impact on society. Components: Lecture Course Equivalents: BY 510 Requirement Group: Prerequisites: BY160 or consent of the instructor Req.  Pharmacology Lab
 The goal of this course is to facilitate a greater understanding of key concepts in pharmacodynamics, pharmacokinetics that are discuss in the lecture component and observe how they are applied in the context of the clinical environment. The lab will be simulation based, employing virtual organ bath experiments to derive and interpret dose-response curves, and virtual patient software to investigate drug pharmacokinetics and dosing strategies.

BY 531(3) Limnology

Limnology (aquatic science) is the study of physical, chemical, and biological properties of fresh water bodies, e.g. lakes, rivers, reservoirs, and wetlands. This introductory course will provide an array of topics that will, by the multi-disciplinary nature of limnology, call upon students' knowledge of biology, chemistry and physics and place them within the context of aquatic science. The focus of the instruction will be aquatic ecology at all levels of biological organization. Upon completion of the course, the student will be able to characterize the physical, chemical and biological/ecological properties of freshwater through the selection and application of appropriate sampling methods. This course covers the same subject area as BY 431 and includes additional materials at the graduate level. Prerequisite: BY222 or CM132 or consent of the instructor.

Components: Lecture

Requirement Group: Corequisite: BY 532 Req. Designation: Technology

BY 532(2) Course ID:011956 2014-12-05 Limnology Laboratory This co-requisite of Limnology (aquatic science) will provide students the opportunity to engage in water sampling of regional lakes and rivers, analysis of samples in the laboratory, introduction to data synthesis, and report writing. Some fieldwork will be required. Components: Laboratory Requirement Group: Corequisite: BY 531

Req. Designation: Technology

Introduction to Biomedical Rehabilitation Engineering and Science [Cross-listed with BR 500] This interdisciplinary course will introduce students to basic principles of biomedical rehabilitation engineering. The course will present principles of disability and the diverse roles of engineering in medicine and rehabilitation. Students will use engineering methods to study anatomical and physiological systems including applications in rehabilitation engineering, bioinstrumentation, biosignal and image processing, biomechanics, and biomaterials.

Prerequisites: MA131/132, PH131/132, junior or senior standing. Lecture

2015-06-01 BY 571(3) Course ID:012092 Anatomy & Physiology I

This is the first semester of a two-semester sequence covering the basic principles of Human Anatomy and Physiology. The course will focus on the anatomical organization and physiology of the human body using a systems approach. Lectures will emphasize a basic understanding of how anatomical organization at the cell, tissue and organ level correlates with physiological processes. Clinical connections will be drawn wherever relevant. In addition to covering the same subject areas as that of BY471, some advanced topics will be discussed and the students will be given additional reading and writing assignments. This course can assist students in finding a relevant research question to pursue investigation in the field of biomedical science. Prerequisite: Graduate standing, or permission of the instructor

BY 582(3) Course ID:011483 2017-01-11 Molecular Genetics

This course will provide students with detailed information on the structure, packages, and expression of genes within the genome of both prokaryotes and eukaryotes. Topics will include chromatin packaging and structure; DNA replication mutation and repair; transcription; RNA splicing; translation; and control of gene expression. Included with each of these topics will be primary research papers, which will discussed during class. During discussions, experiments in the papers will be analyzed as to how they work (focusing on current biotechnology) and critical analysis of the conclusions. Evaluation will involve exams based on material presented during the course as well as participation in discussions and written analysis of presented research papers. This course contains advanced topics and is designed primarily for graduate or advanced undergraduate students. Graduate students will do additional course work.

BY 690(2) Course ID:012739 2016-09-05 Critical Thinking and Research Proposal Development in Biology This course provides a thorough coverage of the essential elements of research proposal writing, a skill that is required throughout one's scientific career but for which formal training is frequently lacking. After an introductory lecture that provides a general overview of the conceptualization and writing of a research proposal, students will be quided through a series of exercises designed to develop these critical skills. Subsequent meetings will be in the form of small tutorial groups with a faculty member leading discussion of primary literature and the outstanding questions in a particular field of research. Students will exchange their written reports with their peers to get feedback from their peers at different stages of draft preparation before submitting them to the faculty instructor for grading. Students will be encouraged to meet with their peers outside of class hours to discuss their reports/proposals. This course aims at preparing IB&B PhD students for their pre-proposal and full proposal writing, which are the written Lecture Components: Attributes: Offered Odd Springs

Human Exposure Analys	
Human exposure analys the environment via i engineering issues, i complexities, uncerta	sis is an emerging science concerned with how humans come into contact with chemicals in .nhalation, ingestion, and dermal contact. The course focuses on scientific and .ncluding direct measurement and model constructs. Students gain an understanding of the tinties, and physical, chemical and biological issues relevant to human exposures
	e and release of toxic compounds. Topics include human exposure analysis terminology, cansport, human activity patterns, occupational exposure, indoor air quality, dosimetry,
	echanistic tools for exposure assessment. For the final project, the students design and
perform a small-scale	e human exposure study using monitoring instruments and/or exposure models. (2 credits of

2021-11-09 CE 441(3) Course ID:007514 Reinforced Concrete Design The investigation and design of reinforced structural elements such as beams, slabs, columns and footings to meet ACI 318 code requirements. (3 credits of design) Components: Lecture Attributes: Three Design Credits, Offered Spring Term Requirement Group: Prerequisite: ES 222; Corequisite: CE 320 Req. Designation: Technology CE 442(3) Course ID:007515 2021-11-09 Steel Design Determination of loads for design; behavior and design of tension members, columns, beams, beam-columns, bolted connections, and welded connections; use of LRFD specifications and the Uniform Building Code. (3 credits of design) Components: Lecture Attributes: Three Design Credits, Offered Fall Term Requirement Group: Prerequisite: CE320 or consent of the instructor. Req. Designation: Technology CE 448(3) Course ID:010696 2022-06-07 Introduction to Architectural Engineering This course will examine the integration of architecture and engineering disciplines in building design and will include introduction to the architectural design process; historical development of architecture/engineering; issues of structural, electrical, HVAC, plumbing, environmental, and acoustical engineering in buildings; economic, construction, and spatial maintenance considerations; professional practice and building codes. Students will be assigned graphic, freehand drawing/sketching, calculation and written exercises as well as a final project. (2 credits of design) Components: Laboratory, Lecture Two Design Credits, Offered Fall Term Attributes: Requirement Group: Prerequisites: ES220 and CE212, or consent of instructor. Req. Designation: Technology CE 452(3) Course ID:007907 2022-06-07 Advanced Strength of Materials A study of properties of materials, general stress-strain relationships, modern strength theories, unsymmetrical bending, curved beams, beams on elastic foundations, and the equations of elasticity and plasticity (1 credit of design) Lecture Components: Course Equivalents: ME 452 Given When Needed Attributes: Requirement Group: Prerequisites: ES222 Req. Designation: Technology Course ID:010562 2018-07-13 CE 453(3) Properties & Performance of Concrete Materials This course explores the materials science aspects of properties and behavior of Portland Cement Concrete, including the properties of raw materials in concrete such as cement, aggregates, mineral and chemical admixtures, and fibers. Topics include: physical and chemical aspects of cement hydration and the role of binder types, the influence of type and morphology of hydrates, fresh and hardened concrete properties, introduction to fracture behavior of concrete, and concrete durability issues such as freezing and thawing, sulfate attack, and corrosion of reinforcing steel. (1 credit of design) Components: Lecture One Design Credit, Offered Spring Term Attributes: Requirement Group: Prerequisite: ES260. Reg. Designation: Technology CE 461(3) Course TD:007516 2015-02-23 Transportation Systems Design Planning and design of transportation systems with emphasis on highway geometric design components, highway pavement, airport and other selected topics. (3 credits of design) Components: Lecture Attributes: Three Design Credits, Offered Fall Term

Requirement Group: Prerequisites: At least junior standing.

Engineering - Civil & Environmental Eng - Subject: Civil and Environmental Eng

2018-07-13 CE 463(3) Course ID:012829 Railroad Engineering [Cross Listed with CE563] This course focuses on principles of railroad transportation and covers the following topics: Railroad engineering efficiency, economics, and energy; Cost-benefit analyses of rail transportation systems; Route selection; Geometric design of railroad alignment; Train speed, power, and acceleration requirements; Railroad engineering materials characterization (rail, crosstie, ballast, sub-ballast, and subgrade); Subgrade design and construction and drainage; and High Speed Rail (HSR) design and construction. Components: Lecture Course Equivalents: CE 563 Attributes: Given When Needed Req. Designation: Technology CE 470(3) Course ID:011710 2021-01-25 River Restoration This course provides fundamental understanding of hydrologic, hydraulic, and geomorphic processes of river restoration systems and their ecological impacts. Topics include river hydraulics, sediment transport, fluvial geomorphology, aquatic habitats, channel design, reservoir sedimentation, dam removal/decommission, and fish passage. Emphasis will be given to fluvial geomorphology and hydraulic design of river restoration projects. Computer modeling of river hydraulics and morphodynamics with applications to river restoration design will be introduced. Components: Lecture Attributes: Offered Fall Term Requirement Group: Prerequisites: CE330; or permission of the instructor. Req. Designation: Technology CE 477(3) Course ID:007520 2021-11-09 Atmospheric Chemistry [Cross-listed with CM 476] This course will cover the evolution of the atmosphere from its initial formation to its natural background condition to its current state perturbed by human activities and reviews appropriate legislation; detailed descriptions of the chemistry of the carbon, nitrogen and sulfur cycles; characterization of the atmospheric aerosol and its role in heterogeneous reaction sand materials transport; stratospheric ozone and problems with its depletion; airborne radio-activity and its role in atmospheric ion chemistry. Components: Lecture Course Equivalents: CE 577, CH 576, CM 476, CM 576 Attributes: Offered Odd Springs Requirement Group: Prerequisites: CM370 or CM371 or ES340. Req. Designation: Technology CE 478(3) Course ID:007521 2022-02-02 Solid Waste Management and Landfill Design This course provides a basic understanding of the essential concepts of solid waste management to include identification, collection, transport, processing and disposal of solid wastes. Emphasis is placed upon the legal requirements and practice resulting from the Resource Conservation and Recovery Act (RCRA) and applicable state law. Solid waste issues include characterization, generation, collection, routes, recycling, landfills, and siting. The design and operation of collection routes, transfer stations, Material Recovery Facilities (MRFs), and landfills are covered. Composting and thermal processing operations are also included. (2 credits of design) Components: Lecture Attributes: Two Design Credits, Offered Even Falls Requirement Group: Prerequisites: Must have junior or senior standing. Req. Designation: Technology CE 479(3) Course ID:007522 2022-06-07 Water and Wastewater Treatment Design A study of physical and chemical operations and biological processes utilized in the treatment of water and wastewater for municipalities and industry. The course emphasizes theoretical and design aspects of these processes. Components: Lecture Course Equivalents: CE 579 Attributes: Three Design Credits, One communication unit, Offered Fall Term Requirement Group: Prerequisites: ES330, CE340, or consent of the instructor.

2016-02-26 CE 506(3) Course ID:012138

Advanced Construction Engineering A study of emerging technologies, trend setting techniques, and new means and methods in construction engineering management. Topics include: emerging technologies which are intended to enhance the analysis, design, construction, performance, and asset management for construction engineering projects; lessons learned from construction sites covering infrastructure and building projects; construction equipment management and selection for construction applications; composite, hybrid, or new materials for construction applications, emerging trends in project delivery, project cost control, and procurement of construction services.

Course ID:011980

Building Information Modeling for Construction Prefabrication This course goes beyond the basics of Building Information Modeling (BIM) moving models from conceptual into application, specifically in order to be able to prefabricate building elements. Students will work to create virtual elements that are then printed via 3D printer or shop prefabricated during the course. The course will cover advanced and emerging techniques and methods to the use of current/state of the art computer aided design software including Autodesk Revit. Prerequisites: Graduate standing, CE 408, or consent of the instructor

Lecture Components: Attributes: Offered Fall Term Req. Designation: Technology

CE 510(3)

Sustainable Infrastructure and Building

An application of the use of sustainability rating systems for infrastructure and building projects. Students will use the USGBC LEED and the ISI Envision systems to execute an analysis of a real or realistic project. Focusing on fundamentals of sustainable construction, this course will acquaint students with the processes required to certify/verify projects to meet an independent rating standard. This course will prepare students to take the LEED GA and/or Envison ENV PV exams

2018-07-13

CE 512(3) Structural Dynamics

Response of discrete/continuous systems to dynamic loading. Formulation/solution of problems of one or more degrees of freedom. Modal analysis. Numerical integration and transform techniques. Response of dynamic systems to base motion using response spectrum methods.

Components:	Lecture
Attributes:	Given When Needed
Req. Designation:	Technology

CE 513(3)

Elastic Waves and Non-Destructive Tests

The course will include 3 modules: elastic waves, inversion, and applications to real-world problems. The module of elastic waves will cover stress propagation problems in elastic solids and waveguides. The module of inversion will include (i) the fundamentals on inverse theory, experimental data and signal processing, (ii) basic inversion methods (global and deterministic optimizations, simulated annealing and genetic algorithm, Gauss-Newton and gradient methods, etc.). Lastly, the module of real-world problems will consist of applications in site characterization, sinkhole detection, unknown foundation, bridge deck evaluation. Prerequisites: Numerical Methods, Partial Differential Equations

Components: Lecture Given When Needed Attributes: Req. Designation: Technology

CE 515(3)

Course ID:007533 Foundations, Stability, and Retaining Structures

2015-02-12

Application of principles of soil mechanics to the design of shallow and deep foundations, retaining structures and slope stability. Interpretation of soil boring logs as related to geotechnical engineering design. Preparation of design templates using spreadsheets. (3 credits of design) Prerequisite: CE310.

Human Exposure Analysis Human exposure analysis is an emerging science concerned with how humans come into contact with chemicals in the environment via inhalation, ingestion, and dermal contact. The course focuses on scientific and engineering issues, including direct measurement and model constructs. Students gain an understanding of the complexities, uncertainties, and physical, chemical and biological issues relevant to human exposures resulting from the use and release of toxic compounds. Topics include human exposure analysis terminology, pollutant fate and transport, human activity patterns, occupational exposure, indoor air quality, dosimetry, and statistical and mechanistic tools for exposure assessment. For the final project, the students design and perform a small-scale human exposure study using monitoring instruments and/or exposure models. (2 credits of design.)

CE 534(3)

Course ID:011709 Sustainable Development Engineering

This course outlines the principles of sustainable engineering for improving sanitation and environmental health in developing communities both internationally and nationally. Topics include sustainable development and appropriate technologies for water and wastewater treatment, water storage and delivery, watershed management, solid waste management, and indoor air quality. The course highlights the importance of community participation and relationship building throughout the development and implementation of engineering projects. At least 2/3 of the course is dedicated to a team-based, sustainable development design project. (2 credits of design)

Groundwater Hydrology and Geochemistry

2022-02-02

2021-11-09

[Cross-listed with EV 535] This class provides fundamental understanding of the key physical and chemical processes impacting groundwater resources and quality. Emphasis is on groundwater geology, physical characteristics of flow, and geochemical properties of groundwater. Groundwater contamination and contaminant transport and modeling will be introduced. The course will prepare students to qualitatively and quantitatively analyze fluid and contaminant flow in varied geologic systems.

CE 538(3) Course ID:007542 2014-11-20 Finite Element Methods

[Cross-listed with MA 572, ME 515] This course is an introduction to the finite element method, from a mathematical as well as a modeling and applications point of view. The basic theory and implementation will be discussed in the context of continuum problems in linear elasticity, potential flow and plate modeling. If time permits, additional applications such as structures, electromagnetics, fluid mechanics, ground water and geotechnics will also be discussed. Topics include: weak formulations and the principle of virtual work, discretization and interpolation-function selection, assembly and solution of the system equations, error estimates and accuracy assessment. When taught in conjunction with CE 438/ME 453 the course requires additional independent work for those registered for the graduate course. Prerequisite: MA232, MA339, or MA330, ES222, ES330 and the ability to program. Consent of the instructor may be used to replace some prerequisites.

Plasticity

Clarkson University

Course Catalog

Run Date: 06/27/2022 Run Time: 14:02:09

Engineering - Civil & Environmental Eng - Subject: Civil and Environmental Eng

Course ID:007576 2022-06-07 CE 633(3)

This course provides an introduction to the subject of plasticity. The physical background of inelastic deformation in metals and geological materials is discussed. Continuum constitutive theory is presented including yield criteria, flow rules, and plastic hardening. Extension to the rate-dependent (viscoplastic) material is discussed. Uniqueness and extremum theorems are derived and discussed and field equations for general, two-dimensional and axisymmetric problems are presented. Selected problems from metal and soil/rock plasticity are presented and solved using various techniques, including slip-line theory, limit analysis and 'exact' methods. Other topics such as localization and diffuse instability in plastic deformation and application of FEM in plasticity are presented as time allows. Prerequisite: CE554 or ME554; recommended CE551 or ME551.

Components: Lecture Course Equivalents: ME 633 Given When Needed Attributes: Req. Designation: Technology

CE 681(3)

Environmental Physico-Chemical Processes

2015-01-20

This class provides fundamental understanding of the chemical and physical processes that govern the migration and fate of pollutants in environmental systems. Emphasis will be placed on the application of these concepts to water treatment processes. Topics include: mass transfer and kinetics, coagulation, precipitation, adsorption, ion exchange, chemical oxidation, sedimentation, filtration and related processes.

Prerequisites: CE340 or CE579 or equivalent course, CE580, or consent of the instructor. Lecture Components: Attributes: Offered Spring Term Req. Designation: Technology

Course ID:007581

CE 682(3)

2015-01-20 Course ID:007582 Environmental Biological Processes

Principles and applications of biological phenomena and processes in relation to environmental engineering practice. Emphasis is given to biokinetic analysis and design of biological treatment processes applicable to the treatment of water, municipal and industrial wastewater and hazardous wastes. Topics include: microbial growth kinetics and bioenergetics; aerobic, anaerobic fixed-film, nitrification, denitrification and phosphorus removal biological processes; sludge treatment and disposal; advanced wastewater treatment processes.

Prerequisites: CE340 or CE579 or equivalent course, CE580, CE584, and BY323, or consent of instructor. Components: Lecture Offered Spring Term Attributes: Req. Designation: Technology

Designation: Technology CH 486(1) Course ID:007611 2017-09-28 Industrial Chemistry [Cross-Listed with CH586/CM486/586]This course will benefit junior and senior undergrads plus grads in chemistry and chemical engineering, and allow them to learn of real ways such talents are used in the professional world. It will involve different industrial chemists and chemical engineers to come to Clarkson University for each of 12 of the 14 weeks of a semester and give two lectures of about 1 hour 15 min each one on an afternoon and the other following morning. The first lecture will relate the areas of chemistry their company was known for; the second lecture an in-depth discussion on how one project was carried out at the bench and the pitfalls that had to be resolved along the way to achieve success. The intent is to select lecturers from Clarkson Chemistry and Chemical Engineering major alumni at various lengths of time they have been professionals. Components: Lecture Course Equivalents: CH 586, CM 486, CM 586 Attributes: Offered Spring Term Requirement Group: Prerequisites: Junior or Senior Standing Req. Designation: Technology CH 490(3) Course ID:007612 2018-12-11 Elementary Transport Phenomena Principles of transport of momentum, energy, and mass will be covered from a fundamental perspective, pointing out analogies where appropriate. Topics include the Navier-Stokes and continuity equations, analysis of one dimensional flows, boundary layer theory, the energy and species conservation equations, energy transport by conduction and convection, steady two-dimensional problems, and unsteady one-dimensional problems. Enrollment is restricted to seniors who will graduate in the calendar year in which the course is offered Components: Lecture Attributes: Offered Spring Term Requirement Group: Prerequisites: CH330 and 3.5 GPA or consent of the instructor. Engineering - Chemical & Biomolecular Eng - Subject: Chemical Engineering

CH 586(1) Course ID:007625 2017-09-28

[Cross-Listed with CH486/CM486/586]This course will benefit junior and senior undergrads plus grads in chemistry and chemical engineering, and allow them to learn of real ways such talents are used in the professional world. It will involve different industrial chemists and chemical engineers to come to Clarkson University for each of 12 of the 14 weeks of a semester and give two lectures of about 1 hour 15 min each one on an afternoon and the other following morning. The first lecture will relate the areas of chemistry their company was known for; the second lecture an in-depth discussion on how one project was carried out at the bench and the pitfalls that had to be resolved along the way to achieve success. The intent is to select lecturers from Clarkson Chemistry and Chemical Engineering major alumni at various lengths of time they have been professionals.

Elementary Transport Phenomena

CH 590(3)

(Cannot be taken by MS or PhD students in Chemical Engineering). Principles of transport of momentum, energy, and mass will be covered from a fundamental perspective, pointing out analogies where appropriate. Topics include the Navier-Stokes and continuity equations, analysis of one dimensional flows, boundary layer theory, the energy and species conservation equations, energy transport by conduction and convection, steady two-dimensional problems, and unsteady one-dimensional problems. Prerequisites: CH 330 and a 3.5 GPA, or instructor consent

Components:LectureAttributes:Offered Spring TermReq. Designation:Technology

CH 610(1 - 2)Course ID:0076272015-02-03Chemical Engineering SeminarStudents, staff and visiting lecturers present research results and topics of current interest. Attendance is required.

Components:SeminarAttributes:Offered Each TermReq. Designation:Technology

CH 611(1 - 15) Course ID:007628 2015-02-03 Thesis, Dissertation Credits

Analytical or experimental studies in chemical engineering under the direction of a faculty adviser. Credit for this work is given when the requirements for the degree are completed including the presentation of a thesis or dissertation as appropriate to the degree program.

Components:Thesis ResearchAttributes:Offered Each TermReq. Designation:Technology

CHM 580(3) Course ID:012239 2021-10-08 MAT Project in Chemistry (Content Area)

The MAT Project is a one-term research project whose purpose is to allow students time and supervision to develop breadth and/or depth of knowledge to become a better teacher in their certification field. What the project will entail varies greatly from student to student. The course is intended to be custom-tailored to meet the specific needs of an individual intern. MAT projects are well-grounded in research and theory, but also include a strong and extensive applied aspect, directly addressing the question: What would this look like in the classroom?

Components: Seminar

Requirement Group: Restriction: This course is open only to students matriculated in the Master of Arts in Teaching progr

Req. Designation: Technology

Forensic Chemistry	course ID:013092 2021-02-26 es the principles, methods and instrumentation of chemistry behind the work of crime

Inis course introduces the principles, methods and instrumentation of chemistry behind the work of crime investigation and will be illustrated with case studies. It will explain how to obtain analytical results through sample preparation, instrumental analysis and data interpretation. It covers topics commonly applicable to the everyday functions of a crime laboratory including forensic analysis of drugs, explosives and inks, DNA profiling, blood analysis etc. The laboratory section will provide an opportunity for students to practice forensic chemistry techniques. This course is open to students with minimal study in chemistry but who are interested in forensic chemistry as well as those with a substantive background in chemistry.

CM 305(3) Course ID:013136 Biochemistry for Health Sciences

This course provides the fundamental knowledge that is essential to the study of biochemistry at advanced levels. This course integrates biochemistry with physiology and cell biology and is aimed specifically at introductory health science students. It provides a general introduction to the biochemical basis of various cellular functions and their relevance to disease. Topics covered include structure, function and chemistry of biomolecules, energy metabolism, molecular genetics, the biochemistry of cancer, and recent biotechnology. The course is intended for health science students who have no previous background in sciences. It assumes no prior knowledge and covers some chemistry and molecular biology basics.

2020-08-25 CM 406(3) Course ID:007669 Biomedical Analysis and Instrumentation

[Cross-listed with BY 406] Biomedical Analysis and Instrumentation is a lecture course designed to provide advanced undergraduates and graduate students in basic sciences, biosciences and bioengineering disciplines with scientific and engineering aspects of instrumentation, sample analysis, measuring and processing signals from living organisms. Functioning and calibration of biomedical transducers and devices actually used in clinical practice for analyzing clinical biomarkers for disease diagnostics will be reviewed. Emerging research in bioinstrumentation, biomedical technologies, stand alone and wearable sensing devices, analytical method development and validation will be also be covered. Special emphasis will be placed on measurement principles of medical instrumentation used in health technologies ranging from laboratory scale to next generation wearables. Training in professional ethics, grant writing, patenting, innovation, entrepreneurial activities and FDA regulation for new device development, laboratory management, as well as communication Components: Lecture

CM 413(3) Carbon Capture and Sequestration

[Cross-listed with CH 413] Sustainable energy generation is seen as one of the largest challenges of our generation. All long-term solutions rely on the direct or indirect conversion of solar energy, yet these solutions appear to be years from implementation. In the coming decades then, while the relative importance of fossil fuels will decrease, absolute use of fossil fuels will not. Carbon Capture and Sequestration (CCS) employed on a global scale can sustain the world's energy use and help mitigate alarmingly high carbon dioxide levels in the atmosphere. The goal of this course is to provide students with a modern view of current and emerging research in CCS. Topics will include our current understanding of carbon dioxide in and around the planet, the geological storage of carbon dioxide, and the science and technology of capturing carbon dioxide with focus on material chemistry aspects. Development of analytical methods and characterization tools for assessing CCS properties and materials will also be discussed. Through this series

This course focuses on the preparation, modification, characterization, and the applications of fine, ultra-fine, and nanosize metallic particles. The objectives are to: a) provide an overview of the relevant theoretical and practical aspects related to the preparation, characterization, and modification of fine particles in general and metallic particles in particular, b) familiarize students with the industrial approaches for developing and manufacturing fine particles on large scale, and c) teach students how the properties of the resulting particles/colloids can be tailored in order to ensure optimal performance in specific applications. During the semester the students will also participate in several practical sessions in which metal colloids will be prepared and characterized.

Designation: Technology CM 466(3) Course ID:010918 2015-01-23 Bioelectronics & Bionanotechnology This course covers novel areas in science and technology that have high importance for fundamental science and practical applications. Bioelectronics is a scientific and technological area that includes electronic coupling of biomaterials (enzymes, DNA, recognition proteins, biological cells) with electronic devices. The bioelectronic systems can be used to develop sensing devices (enzyme-based biosensors, DNA sensors, immunosensors, etc.) and to develop biofuel cells (implantable biofuel cells for biomedical applications,

self-powered biosensors, autonomously operated devices). New methods and new materials (functionalized nanoparticles, quantum dots, carbon nanotubes, etc.) developed due to the tremendous recent success in nanotechnology pave the way for the novel possibilities to couple biomaterials and electronic transducers, thus resulting in the new technological field named Bionanotechnology. The students will be introduced into the most important areas of Bioelectronics and Bionanotechnology.

This course will cover the basics of the structure of periodic solids, relate that understanding to solid interfaces, and finally address how surface structure and reduced dimensionality impact chemical reactions (i.e. hetergeneous catalysis). Analytical techniques common to this discipline will also be discussed. Graduate students will be assessed differently than undergraduates in this course. Graduate students will

have the additional responsibility of delivering a presentation discussing one of several primary research articles germane to the field that were selected by the instructor, while undergraduate students will submit a paper describing one of these articles in detail.

Sustainable Nanotechnology The goal of this course is to provide graduate students and advanced undergraduates with a modern view of current and emerging research in nanotechnology. Topics will include: fundamental nanoscale properties and applications, green manufacturing and assembly in functional devices, interaction of nanomaterials with biological systems, the physical and chemical phenomena at nano-bio interfaces, fate, transport and transformation of engineered nanomaterials, environmental and health impact, nanometrology, nanotxicology and hazard identification of nano-based products. Development of analytical methods and characterization tools for assessing nanoscale properties and materials will also be discussed. Students will be exposed to interdisciplinary topics and an integrated training bridging material and environmental sciences with biology and analytical chemistry. Students will be able to demonstrate a basic awareness of risks and benefits of emerging technologies and evaluate overall environmental and societal impact.

Functioning and calibration of biomedical transducers and devices actually used in clinical practice for analyzing clinical biomarkers for disease diagnostics will be reviewed. Emerging research in bioinstrumentation, biomedical technologies, stand alone and wearable sensing devices, analytical method development and validation will be also be covered. Special emphasis will be placed on measurement principles of medical instrumentation used in health technologies ranging from laboratory scale to next generation wearables. Training in professional ethics, grant writing, patenting, innovation, entrepreneurial activities and FDA regulation for new device development, laboratory management, as well as communication Components: Lecture Course Equivalents: BY 406, CM 406, BY 506 Attributes: Given When Needed Req. CM 513(3)

Carbon Capture and Sequestration

[Cross-listed with CH 513] Sustainable energy generation is seen as one of the largest challenges of our generation. All long-term solutions rely on the direct or indirect conversion of solar energy, yet these solutions appear to be years from implementation. In the coming decades then, while the relative importance of fossil fuels will decrease, absolute use of fossil fuels will not. Carbon Capture and Sequestration (CCS) employed on a global scale can sustain the world's energy use and help mitigate alarmingly high carbon dioxide levels in the atmosphere. The goal of this course is to provide students with a modern view of current and emerging research in CCS. Topics will include our current understanding of carbon dioxide in and around the planet, the geological storage of carbon dioxide, and the science and technology of capturing carbon dioxide with focus on material chemistry aspects. Development of analytical methods and

characterization tools for assessing CCS properties and materials will also be discussed. Through this series Components: Lecture

Manufacturing Implications of Advanced Materials Processing The processing of materials into manufactured goods requires an understanding of the chemical composition of the starting substrates, the nature of intermediates, and the properties of final products. This course focuses on the preparation, modification, characterization, and the applications of fine, ultra-fine, and nanosize metallic particles. The objectives are to: a) provide an overview of the relevant theoretical and practical aspects related to the preparation, characterization, and modification of fine particles in general and metallic particles in particular, b) familiarize students with the industrial approaches for developing and manufacturing fine particles on large scale, and c) teach students how the properties of the resulting particles/colloids can be tailored in order to ensure optimal performance in specific applications. During the semester the students will also participate in several practical sessions in which metal colloids will be prepared and characterized. Graduate students will do additional work, such as a term paper or review Components: Lecture

Course ID:010919 Bioelectronics & Bionanotechnology

This course covers novel areas in science and technology that have high importance for fundamental science and practical applications. Bioelectronics is a scientific and technological area that includes electronic coupling of biomaterials (enzymes, DNA, recognition proteins, biological cells) with electronic devices. The bioelectronic systems can be used to develop sensing devices (enzyme-based biosensors, DNA sensors, immunosensors, etc.) and to develop biofuel cells (implantable biofuel cells for biomedical applications, self-powered biosensors, autonomously operated devices). New methods and new materials (functionalized nanoparticles, quantum dots, carbon nanotubes, etc.) developed due to the tremendous recent success in nanotechnology pave the way for the novel possibilities to couple biomaterials and electronic transducers, thus resulting in the new technological field named Bionanotechnology. The students will be introduced into

the most important	areas of Bioelectronics and Bionanotec	hnology.

CM 567(1) Course ID:012760 2022-02-02 Biofuel Cells - Design and Applications

This is a lecture course designed to provide graduate students with a working knowledge in the highly multidisciplinary research area of biofuel cells (including microbial, enzyme-based and "abiotic" biofuel cells, their construction, operation and various applications). The course will include a brief overview of microbial fuel cells. The "abiotic" biofuel cells based on the use of inorganic catalytic species (mostly catalytic nanoparticles) will be studied in connection with the general information on nanoparticles and their immobilization on electrodes. The main part of the course will be devoted to the enzyme-based biofuel cells and their biomedical applications, particularly as a potential power source for implantable biomedical devices (e.g., pacemakers). The scientific advances and technical problems will be discussed. The course is addressed to graduate students with different backgrounds, including students from chemistry and biomolecular science, biology, chemical engineering and electrical engineering. CM 569(3) Course ID:013122 2022-02-02 Implantable and Wearable Bioelectronics

Chemistry CM469/569 is a lecture course designed to provide graduate students and advanced undergraduates with a working knowledge in the multidisciplinary research area of bioelectronics, giving particular information about implantable and wearable bioelectronics. The course will concentrate on concepts, experimental realizations and practical applications. This course covers novel areas in science and technology that have high importance for fundamental science and practical applications. Major science areas covered by the course will be in chemistry, particularly biochemistry and electrochemistry. Minor sub-areas studied in the course will be related to biomedical applications and electrical/electronic engineering. All studies in the course will not require any background knowledge except general chemistry and basics of biochemistry. The major topics covered by the class will be related, but not limited, to biosensors, biofuel cells, bioelectronic devices concentrating on the concepts rather than technical details. The course work for

CM 570(3) Course ID:007752 2015-01-20 Biochemistry & Biotechnology Laboratory This course is a one semester course in the fundamental laboratory approaches for biochemistry and biotechnology. While largely a hands-on course, laboratory experiments will be supplemented with lectures that integrate the theoretical and practical principals covered in the exercises. Topics include protein purification, characterization and analysis, enzyme kinetics and molecular modeling. Prerequisites: BY312 or CY450 or CM460 or consent of the instructor. Components: Laboratory Attributes: Offered Spring Term Req. Designation: Technology
CM 572(3) Course ID:007753 202-02 Chemistry at Surfaces: Structure and Catalysis This senior undergraduate and graduate course will survey the field of surface chemistry, with specific attention dedicated to the structure of solid surfaces and chemical processes at solid interfaces. This course will cover the basics of the structure of periodic solids, relate that understanding to solid interfaces, and finally address how surface structure and reduced dimensionality impact chemical reactions (i.e. hetergeneous catalysis). Analytical techniques common to this discipline will also be discussed. Graduate students will be assessed differently than undergraduates in this course. Graduate students will have the additional responsibility of delivering a presentation discussing one of several primary research articles germane to the field that were selected by the instructor, while undergraduate students will submit a paper describing one of these articles in detail. [Cross Listed with CM481] Computational Chemistry is senior undergraduate and graduate course which will discuss theoretical and computational methods in chemistry and their applications. This course will include both lectures and computer lab. The lectures will introduce the fundamental theories and methods in chemistry and their applications in the cutting-edge research. The computer lab will be hands on tutorials on calculating the structures and properties of chemicals, exploring the reaction mechanisms, reactivities, and selectivities. The objectives of this course are: (1) to provide students with the basic background of computational methods by class project. (3) to encourage their creativity, critical thinking and problem-solving ability. Graduate students will have additional course work.

Industrial Chemistry

[Cross-Listed with CM486/CH486/586]This course will benefit junior and senior undergrads plus grads in chemistry and chemical engineering, and allow them to learn of real ways such talents are used in the professional world. It will involve different industrial chemists and chemical engineers to come to Clarkson University for each of 12 of the 14 weeks of a semester and give two lectures of about 1 hour 15 min each - one on an afternoon and the other following morning. The first lecture will relate the areas of chemistry their company was known for; the second lecture an in-depth discussion on how one project was carried out at the bench and the pitfalls that had to be resolved along the way to achieve success. The intent is to select lecturers from Clarkson Chemistry and Chemical Engineering major alumni at various lengths of time they have been professionals.

COMM 226(3) Course ID:012000 2015-03-05 Short Film Screenwriting [Cross-listed with FILM 226] In this course, you will learn the process of writing short screenplays for narrative fiction films of any genre. Short films can be anywhere from 30 seconds to 40 minutes long, though the majority of them fall between seven and fifteen minutes. Each student will complete two short scripts and then revise one of these from the ground up. Since this is a workshop, you are expected to comment thoughtfully on your classmates' work, as they will comment thoughtfully on yours. Though there is some reading in this course, your primary concern should be writing, writing, writing! Components: Lecture Course Equivalents: FILM 226 Two communication units, Imaginative Arts, Given When Needed Attributes: Req. Designation: Technology

COMM 229(3) Course ID:012826 2017-08-15 Principles of User-Experience Design
This course introduces the processes and practices of user experience design (UXD) as it applies to websites, applications, and product development, and includes grounding in theories and techniques for developing websites,
user-interfaces, media artifacts, and products. Students think critically about and practice design thinking and iteration, analyze and theorize design choices, communicate ideas in multimedia, collaborate with others, perform research, hypothesize, conduct tests, and report data. By the end of the course, students will have a solid understanding of major user-experience design methodologies. Components: Lecture
Attributes: Two communication units, Imaginative Arts, Offered Spring Term Req. Designation: Technology
COMM 245(3) Course ID:012970 2021-03-25
Writing for Media Writing for Media helps students learn to write for a people in diverse types of media and genres, ranging
from traditional areas such as journalism through social media. Students vill develop skills at analyzing communication needs in diverse contexts; writing communications that work effectively for readers, viewers, listeners, and users in those contexts. Students will also learn how to adapt their own skills to emerging media in the future. Components: Lecture
Attributes: Imaginative Arts, Given When Needed Req. Designation: Technology
COMM 310(3) Course ID:009612 2022-03-08
Mass Media and Society
This course consists of readings in and analysis of modern media communication and its influence. It includes
the history of the media, media control, and various media effects on special audiences and on the
development of other media. The course centers on an analysis of how society controls the media and how the
media controls society. The course is based on discussion of opinion pieces and other readings.
Components: Lecture
Attributes: Contemporary and Global Issues, Science, Technology and Society, University Course,
Offered Fall Term Req. Designation: Technology
COMM 312(3) Course ID:011664 2015-01-23
Public Relations This course will introduce students to the history, nature, theory and practice of public relations in the United States by examining the activities of public relations professionals and firms. Attention will be
given to the communication process and how persuasion is employed to influence various publics via traditional PR strategies and approaches, as well as how emerging media are changing current practice in various fields (e.g., health care, entertainment, government, and non-profits). Frequent practical exercises, communication tasks, and activities could include developing written and/or video press releases, maintaining
a blog, running a press conference, planning events for a PR campaign in coordination with a client's goals, creating 'press kits,' developing strategies for building relationships with the media, developing a crisis communication plan for an organization, and associated oral presentations.

Professional Communication
[Cross-listed with EM313] This course presents students opportunities to learn how to design and present effective professional documents. The course emphasizes a rhetorical approach to analyzing the issues and details important to the communication to be produced (e.g., audience, style, format, purpose). Students will practice writing both individually and collaboratively and will be expected to present their work orally
on occasion. Students will encounter topics such as, but not limited to, abstracts, email, instructions, letters, memoranda, proposals, and various types of reports. Students of any major may take this course. Components: Lecture

2019-02-07 COMM 314(3) Course ID:012925

This course includes a foundational understanding of the construct of Placemaking or the ways in which people in places at various geographic scopes (neighborhood, community, town, or region) explore collaboratively their needs and develop planning and entrepreneurial strategies for more livable, sustainable and productive communities. This exploration interrogates multiple disciplines and fields including physical geography, architecture, community planning, sustainability certification programs (e.g., LEED), civic engagement, entrepreneurism, regulatory frameworks, as well as current trends in the literature and practice. A focus will also be on Creative Placemaking initiatives that put artists and The Arts at the forefront of community development. The course also builds on this foundation to examine the various ways in which communities utilize Placebranding as well as Marketing and Promotional Strategies to reach their goals including tourism, residential growth and sustainable, economic development.

STEAM Journalism Writing is one of the most varied fields in the modern workforce. From full-time and freelance journalists covering breaking news - to media writers and PR professionals working in-house to tell organizational stories across multi-media and even technical genres, the role of "writer" is complex and diverse. What has become more evident with advances in technology is that writers in these wide-ranging capacities, whose task is to illuminate stories about science, technology, engineering and math (STEM), have something in common: integration of the "Arts" (the addition of "A") to deepen and contextualize stories embedded in technical information and data. These approaches take the form of creative practices, elements, design principles, and standards, to foster inquiry, collaboration, and emphasis on process-based writing. This course introduces students to journalism, field and practice, and the ways in which journalism is evidenced in writing roles and functions in organizations and media production. Students will focus experientially on developing and Lecture Components:

Health Communication

This course explores topics at the intersection of health communication and health promotion. We will explore research, theory, and practice across levels of communication (i.e., interpersonal, organizational, intercultural, mass) and evidence for their influence on health behaviors and outcomes. Relevant topics include health information seeking, patient-provider interactions, social support (i.e., patient-patient & patient-caregiver dyads), and communication within healthcare organizations conducted in-person or through mediated environments (e.g., telehealth, social media, virtual reality). Strong attention will be paid to the role of communication in health disparities relevant to culture, rurality, and literacy.

COMM 317(3)

Course ID:013150 Public Discourse and Dialogue Across Difference

This course is centered in critical approaches to intersectional human differences across the spectrum of identity. The content, classroom conversations, and texts you produce will focus on issues of race, gender, class, sexuality, and ability differences across multiple discursive contexts. We will consider how we define and constitute identities (both others' and our own) and how our identity is constituted for us. We will consider the ways we write, talk, think, and feel about identity and broader social inequities -- with the intent of getting to a level of comfort where we can readily engage in meaningful conversations on these subjects both in and outside the classroom without resorting to hostility and further division. Lecture Components:

School of Arts and Sciences - Communication, Media & Design - Subject: Communication

COMM 326(3) Course ID:011955 2015-03-05

In this course, you will learn the process of writing a feature-length screenplay. You will devise an original story idea, craft intermediate documents (i.e. logline, treatment, and beat sheet), and then write a first draft. Our goal is not to complete a polished draft (most screenplays go through at least a dozen revisions), but rather to execute a full draft in proper screenplay format that hits all the dramatic turning points, fleshes out characters and dialog, and leaves you will a document ready for substantive revision - now that you know what you're writing. Since this is a workshop, you are expected to comment thoughtfully on your classmates' work, as they will comment thoughtfully on yours. Along the way, you will read several professional scripts and complete a brief critique of each. We will also learn about the profession of screenwriting, including what to do with finished scripts, how to seek representation, and what the Writers Guild of America is. Though there is a good amount of reading in this course, your primary concern should be

Digital Video Production I This course presents students with a hands-on opportunity to gain knowledge and experience in digital video production. The focus of this course will be on mastering the technical fundamentals of video production: recording high quality video and audio, lighting, editing, and color grading. Students will work alone and in small teams to produce video projects throughout the semester and will have the opportunity to gain experience in the entire video production process from conceptual development though video delivery. Emphasis will be on practical exercises with material presented via lectures, discussions, and hands-on practice.

Lecture Components: Given When Needed Attributes: Req. Designation: Technology COMM 410(3) Course TD:009633 2022-03-08 Theories and Philosophies of Communication This course explores a range of approaches to understanding human communication, including work from communication, philosophy, cognitive science, social science, and more. Through extensive reading, discussion, and writing, students investigate how people communicate-and miscommunicate-with each other as individuals and communities. Components: Lecture One communication unit, Individual and Group Behavior, Given When Needed Attributes: Req. Designation: Technology COMM 412(3) Course ID:009635 2015-01-23 Organizational Communications and Public Relations Theory This course examines the nature of the organization and the strategic communication processes that build relationships between organizations and their publics. Through assigned readings, lectures, and class discussion and analysis, students are exposed to communication theory and trends relevant to the workplace. Students will examine the communicative implications of such topics as organizational structure and goals; corporate culture; managerial schools of thought; leadership styles; superior-subordinate relationships; and communication consulting. In addition, students will address communicative implications in a changing economy; employee loyalty and dissent; gender and the workplace; and corporate image in crisis situations. This course seeks to provide students with insight into the organizational context, not only to make them more effective communicators but also to help them make informed choices in their careers. Components: Lecture Attributes: One communication unit, Individual and Group Behavior, Given When Needed Reg. Designation: Technology COMM 415(3) Course TD:013060 2020-10-13 STEAM Journalism Writing is one of the most varied fields in the modern workforce. From full-time and freelance journalists covering breaking news - to media writers and PR professionals working in-house to tell organizational stories across multi-media and even technical genres, the role of "writer" is complex and diverse. What has become more evident with advances in technology is that writers in these wide-ranging capacities, whose task is to illuminate stories about science, technology, engineering and math (STEM), have something in common: integration of the "Arts" (the addition of "A") to deepen and contextualize stories embedded in technical information and data. These approaches take the form of creative practices, elements, design principles, and standards, to foster inquiry, collaboration, and emphasis on process-based writing. This course introduces students to journalism, field and practice, and the ways in which journalism is evidenced in writing roles and functions in organizations and media production. Students will focus experientially on developing and Lecture Components: Req. COMM 428(3) Course ID:009647 2022-03-08

This course focuses on the intersection of theory, environmental challenges and communication; specifically, the ways in which varied people and stakeholders identify, label, frame, shape, and convey these challenges, as well as the ways in which they make decisions and policies in the public sphere at varied scopes and levels of governance, and in the face of risk and uncertainty. Exploration includes historic and contemporary environmental movements, key leaders and figures, environmental law and seminal policy frameworks, including agencies and institutions, and the ways in which we are grappling with current challenges through communication mediums and changing media. Students will engage in critical reading, case studies, discussion, and research, as well as guest speaker presentations and field trips when possible. Components: Lecture Attributes: Contemporary and Global Issues, Science, Technology and Society, University Course, Given When Needed

Req. Designation: Technology

Environmental Communication

COMM 429(3) Course ID:012974 2019-10-21

This course focuses on systematically developing and deploying web technologies in contexts ranging from the personal to the professional. Students will develop with major back-end technologies and learn the related disciplines of server administration, content management, information architecture, and scalable application development. By the end of the course, students will be able to build and deploy applications, write and debug server-side code, design, implement, and administer content management systems, and plan and manage large-scale development projects. The primary languages students will develop facility with include PHP, SQL, Javascript, and Ruby (as well as HTML5 and CSS3).

COMM 447(3)

Advanced Design Thinking

Full-stack Development

This course focuses on design frameworks, processes, and tools for invention, innovation, and change. With their emphasis on out-of-the-box thinking, creativity, and originality, these frameworks both build on and go beyond the Design Thinking methods taught in COMM347. Examples include Double Diamond Design, Frame Innovation, and Far Field Design. During the semester, you will find and solve several challenges within your chosen area(s) of interest. In keeping with a design orientation, classes will follow a studio format, where studio entails creatively making to learn in hands-on ways.

Narrating Innovation

This course focuses on innovation from a design-led perspective. During the semester, you will find and solve several innovation challenges within your chosen area(s) of interest. Relative to "design" we will use a number of design lenses, ranging from easy to difficult, and from incremental to frame-changing. In keeping with a design orientation, classes will follow a studio format, where studio entails "creatively making to learn in hands-on ways." Hands-on means that you will work on challenges using both 2D and 3D methods (e.g., modeling, prototyping, enacting). "Innovation" can be defined in many ways; here we will broadly think of it as both inventive (coming up with original, creative solutions) and potentially generative (creates some kind of good-societal, commercial, or otherwise).

Designation: Technology 2(2 - 4) Course ID:008063 2015-08-15 CS Computer Science Elective A college level course for which there is no comparable Clarkson course. Used for transfer credit only. This course may be used to satisfy a Programming Foundation Curriculum Requirement. Independent Study Components: Transfer Credit Only Attributes: Req. Designation: Technology 2015-08-15 CS 141(4) Course TD:007813 Introduction to Computer Science I This course is an introduction to basic concepts of computer science, with emphasis on programming. Computer programming is to the study of computer science what writing is to the study of literature. It is a primary tool for implementing algorithms in computer science. Fundamental techniques for software design and implementation will be covered and these concepts demonstrated in a programming language like C++. Additional topics include top-down modular design, developing general-purpose software tools, procedural and data abstraction, algorithms, and an introduction to recursion and dynamic data structures. The course consists of three hours of lecture and a one hour computer laboratory session per week. Components: Laboratory, Lecture Course Equivalents: EE 261 Attributes: Offered Each Term Req. Designation: Technology Course ID:007814 2015-08-15 CS 142(3) Introduction to Computer Science II This course will further develop and expand upon the topics introduced in CS 141. Advanced programming techniques will be covered, with extensive use of recursion and dynamic data structures. Abstract data types, including lists, queues, trees and graphs, will be studied. Specific emphasis will be given to tree traversals and binary search trees. Algorithms for searching and sorting will be explored along with methods of comparative analysis. The topics in this course provide an essential foundation for the further study of computer science. Components: Lecture Offered Each Term Attributes: Requirement Group: Prerequisites: CS 141 or equivalent Req. Designation: Technology Course ID:007815 CS 241(3) 2015-08-15 Computer Organization An introduction to computer organization and assembly language programming. Topics include the functional organization of computer hardware; data representation, and computer arithmetic; instruction sets, addressing modes and low-level I/O. Introduces machine and assembly language, and systems programming techniques in the programming language C. This course serves as a foundation for courses on operating systems, compilers, networks, and computer artchitecture. Components: Lecture Attributes: Offered Spring Term Requirement Group: Prerequisites: CS 142 or equivalent Reg. Designation: Technology 2019-04-03 CS 242(3) Course ID:007816 Advanced Programming Concepts in Java This course builds upon the foundation topics covered in CS 142, and covers concepts and skills required for real-life, modern programming. Topics will include basic object-oriented programming design, graphical user interfaces (GUIs), exception handling, multithreading and synchronization, networking, and client/server applications. The programming language Java with its companion OOP/GUI libraries will be used to illustrate these topics. This course will emphasize team programming on a large-scale project with a realistic deadline. Lecture Components: Offered Fall Term Attributes:

2019-04-24

2019-04-03

2018-10-12

[Cross-listed with CS569 and MA469] This course studies information and computation based on quantum mechanical laws. The first part of the course will cover the relevant background in quantum information theory. A brief discussion of several universal quantum computational models will be given. The second part will cover algorithmic techniques important for developing quantum algorithms. Topics to be covered include amplitude amplification, quantum walks, phase estimation, hidden subgroup problems, and quantum protocols. Background in physics would be helpful but is not required. Components: Lecture

2016-07-01 CS 500(3) Course ID:012269 Network and Security Systems

[Formerly CSC 560] This course explores critical business challenges: how to protect an organization's computer networks, systems, applications and information. Students learn how to design procedures, protocols, and policies that address both engineering and human issues. Engineered security is examined through the application or cryptography, digital signatures and certificates, authentication protocol, firewalls, and intrusion detection. Also considered are security issues related to people's use of organization's networks and systems including policies and practices for password management and protecting privacy rights. Students also study options for maintaining business continuity in the event of a disruption of business operations. Specific case studies are used to highlight the choices that must be made to balance operational efficiency of business functions with protecting the business from the onslaught of security threats. Prerequisite expertise: Networking protocols. The student should have taken a course in computer communications/networking Components: Lecture

Business Intelligence

Course ID:012271 2016-07-01

[Formerly CSC 562] This course offers an interdisciplinary look at computing technologies in support of forming valuable business insights and making effective decisions. Students acquire knowledge of the conceptual basis for data warehousing (collection and organization of data in database management systems) and data mining (detecting of patterns in business data). Students then build the skills to extract business intelligence from collected and analyzed data and present it for use in business decision-making activities. Various practical applications are studies such as customer segmentation, Customer Relationship Management (CRM), Group Decision Support Systems (GDSS), and Executive Information Systems (EIS). Students will learn about trends in the use of business intelligence software and techniques and examine specific case studies. There will be an opportunity for students to develop their own application project. Prerequisite expertise: database management systems.

Components: Lecture Req. Designation: Technology

CS 503(3)

Course ID:012273 Systems Analysis and Design Methods

[Formerly CSC 564] The application of information technology has extended to all quarters of the business world. While the nature and the scope of information systems vary widely depending on the business context, the fundamental knowledge underlying their development remains the same. This course aims to provide technology students with a solid understanding of the important methodologies and tools & techniques related to the development of information systems in a variety of contexts.

CS 505(3) Business Data & Communications & Networking 2016-07-01

[Formerly CSC 583B] This course is designed to convey the essentials of data communication networks. It will cover concepts, technologies and architectures. There will be practical lessons built into the semester's topics and assignments whenever possible. A single course cannot cover all possible networking topics and issues, so we will cover the major conceptual areas balanced with practical discussions and exercises. We will also discuss important network management topics such as domain management and security. Specifically, the following topics will be covered: Fundamentals of Networking Technologies, OSI Model, Physical Layer, Data Link Layer, Local Area Networks, Wireless Local Area Networks, Network/Transport Layers TCP/IP, Backbone Networks, Wide Area Networks, Application Layer, The Internet, Network Design, Network Management and Network Troubleshooting, Network Security, Voice over IP. CS 506(3) Course ID:012275 2016-07-01 Engineering Statistics [Cross-listed with EE 602, ME 577] [Formerly CSC 572] Modern engineering practice makes extensive use of statistical methods for the efficient collection and analysis of engineering data, and to support data-based decision making. This course will introduce the statistical tools that are of greatest importance for practicing engineers. Core topics to be covered will include probability and distribution theory, the construction and interpretation of statistical intervals, statistical hypothesis testing, regression analysis and empirical modeling, statistical experimental design, and statistical quality/process control. Additional specialized topics may also be covered, depending upon the interests of the class; possible topics include system reliability analysis, measurement system analysis, process capability analysis (and "six-sigma"),

Blockchain Technologies

Blockchain technologies are the underlying technological foundation of almost all digital currencies, such as Bitcoin and Ethereum. Without the need of a trusted authority or central server, Blockchain technologies can securely archive and are inherently resistant to modification of data. The course will cover the basics and advanced topics of Blockchain technologies. The basics include public key cryptography and cryptocurrency, hashing algorithms, mining process, proof of work, block structures, transactions and wallets. Advanced topics may include consensus algorithms, smart contracts, blockchain network security and applications. We will discuss the limitations of current applications and explore new systems and proposals that overcome them. The course will offer many hands-on lab components and a blockchain-based course project. Students should already have had solid programming skills, such as C, C++ or Python, to take the course. Students will be expected to independently explore some of the course material.

Quantum Information and Computation

CS 570(3)

CS 569(3) Course ID:012899 2019-04-24

[Cross-listed with CS469 and MA469] This course studies information and computation based on quantum mechanical laws. The first part of the course will cover the relevant background in quantum information theory. A brief discussion of several universal quantum computational models will be given. The second part will cover algorithmic techniques important for developing quantum algorithms. Topics to be covered include amplitude amplification, quantum walks, phase estimation, hidden subgroup problems, and quantum protocols. Background in physics would be helpful but is not required. As part of a research project, students are expected to explore topics of interest from the literature. Prerequisites: CS344, and MA232 or MA339, or consent of the instructor.

Course ID:012939 2019-04-03

Deep Learning This course will cover the principles of modern deep learning architectures from a theoretical and practical perspective. Course topics covered will include an introduction to machine learning and basic neural network architectures, and in-depth discussions on convolutional neural networks, recurrent neural networks based on units such as LSTMs and GRUs, and, if time permits, GANs. Students will be required to implement programming assignments and projects that apply deep learning architectures to solve classification and regression problems. Students will read and assess papers on current evolutions to these architectures. Graduate students will do additional work. Prerequisites: CS142, EE262 or EE361, and MA339, or consent of instructor. Lecture

System Administration and Network Operations This course is designed to give students the basic skills and knowledge to administer Unix/Linux machines as standalone workstations or in a network environment. For example, students will learn to install and configure the Linux operating system, create and maintain system users and groups, maintain and administer a file system, configure and maintain network services, troubleshoot system and network problems, and secure the system and network environment. Comprehensive hands-on labs throughout the course will reinforce learning and develop skills and competency. Graduate students will be expected to explore independently advanced aspects of the subject area. Prerequisite: CS241 or equivalent

Image Understanding

CS 572(3)

This course is an introduction to image processing and computer vision algorithms. Students will learn concepts such as image formation, how to store a digital image on a computer, how to use it in a program, different image features and their importance in computer vision, as well as some advanced computer vision topics such as object classification. Students will implement these concepts as part of the programming assignments. They will also do some theoretical assignments and a project. Students enrolled in CS572 will study a research paper on related topics and present it to the class. Prerequisites: CS142 or EE262 or EE361, and MA232 or MA239 or MA339, or equivalent.

CS 573(3)

Computer Vision

[Cross-Listed CS473/EE573] This course will cover an overview of basic theoretical underpinnings and practical applications of computer vision, with particular emphasis on geometrical techniques underlying 2D and 3D vision. Topics covered include, but are not restricted to, estimation of image transformations, image formation, pose estimation, camera calibration, epipolar geometry, structure-from-motion, stereo reconstruction, filtering, interest point detection, motion estimation, image segmentation, and object recognition. Students enrolled in CS573 will be expected to read and implement research papers on seminal and modern techniques in computer vision. Prerequisites: CS142 or EE262, and MA339 (or equivalent, with consent from the instructor).

CS 575(3)

Computing, Ethics and Society

[Cross-Listed CS475]This course focuses on the increasing ubiquitous nature of computing, its impact on society and the ethical issues related to the design, implementation and deployment of computing technologies. We will examine case studies of the impact of computing technology on society and reflect on issues such as privacy, equality, justice, security, accountability, transparency, safety and reliability. Students enrolled in CS575 will become familiar with venues where computer science research regarding fairness, accountability, transparency and ethics is published and the types of topics and themes commonly covered in this literature today. They will gain skills in reading research literature and apply this to some pieces of recently published work. Prerequisites: CS141, or equivalent.

Advanced Topics in Deep Learning

This course is designed to provide fundamental and specialized knowledge on various deep learning topics and, in the process, prepare students for independent research on real-world problems that require machine learning solutions. The course will cover fundamental topics in learning theory such as Hoeffding's Inequality, Vapnik-Chervonenkis (VC) Dimension, and bias-variance tradeoff. The course will also cover specialized deep learning topics such as instance segmentation, image caption generation, and multi-task learning. The course assessment will include programming assignments that will require the students to implement deep learning models using a programming language such as Python and libraries such as Keras and TensorFlow. Students will also be required to study and present academic papers on related topics and complete a research project.

Advanced Topics in Human-Robot Interaction

The course will cover current research in human-robot interaction (HRI), i.e., what it takes for robots to be seamlessly integrated into human environments, while being aware of human needs. The course will cover interdisciplinary work that integrates topics in robotics, artificial intelligence, computer vision, language understanding, human-computer interaction, and psychology. Through collaborative instructor and student-led discussions of HRI literature, students will receive an understanding of mathematical techniques, study design methods, and societal impact of research in HRI. To demonstrate their understanding of material and dedication toward contributing toward societally impactful HRI, students will perform an end-to-end project with research outcomes of interest to HRI.

DA 343(3) Course ID:013132 2021-10-12 3D Digital Character Animation	
This studio course covers principles of character animation and visual storytelling in relation to topics such as character acting, lip syncing, and game character cycles. With a focus on narrative-driven animation, the course engages with storyboarding, virtual camera cinematography and staging, as well as an exploration of narrative structures in relation to time-based media. With the emphasis on character animation rather than character creation, the course relies predominantly on pre-built assets as the starting point for animations. School of Arts and Sciences - Mathematics - Subject: Data Science

Course ID:012919 2021-05-14 DS 241(3)

[Cross listed as MA 241]This course introduces the basics of data manipulation and pre-processing to analyze data for statistical decision-making, building the skills required to organize, visualize, and communicate using data. The course seeks to help students address this question: given data from the world of science, engineering, medicine, etc., collected from multitude of sensors and sources, how do you begin to make sense of that data - and how do you use it? The primary tool for coding will be R/RStudio, but supporting Python syntax and libraries may also be introduced. The course emphasizes not only the low-level coding skills, but also the higher-level critical and quantitative reasoning skills required to analyze real-world datasets. Topics introduce key concepts such as descriptive statistics and sampling distribution (as a means to view large and very large data sets) and the basic analysis tools of Linear Regression and Data Mining. Additional topics may include social network data, unstructured data, and natural language text processing.

DS 392(3) Ethics in Data Science and Applied Mathematics

Introduction to Data Science

2018-10-08

This course will consider real situations in which computational or data science delivers capabilities that may conflict with societal values. Students will analyze frameworks for promoting ethical decision making, such as audits, codes of conducts, and legal regulations. They will discuss how data-driven decision making can be aligned with societal values. (Discussion topics may include things like data stewardship, secondary-effect analysis, political and legal roles of mathematical professionals, and representative workforce.) Guest speakers from both physical and social sciences will introduce relevant, real-world examples, with a portion of course time dedicated to discussion of daily news items that relate to the topics of this course.

questions in economic causes recessions? Wh	e study of the economy as a whole and cs such as: Why is there unemployment ny are some nations rich while others	d is concerned with some of the most important ? What are the sources of rapid inflation? What s are poor? Why do some economies grow faster than s course analyzes the economy in a "general	

others do? Can policymakers "fine-tune" the economy? This course analyzes the economy in a "general equilibrium" framework, where the performance of the economy in terms of output, employment and unemployment, inflation and international capital flows is determined by the simultaneous interaction of the goods, labor, money, and international markets. The course will highlight the critical difference between the economy in the short and long run, the important role that expectations about the future play in macroeconomic analysis, and transmission mechanisms of fiscal and monetary policy in efforts at economic stabilization.

EC 605(3) Course ID:008092 2017-11-13 Managerial Economics

[Cross-listed with EC 604] This is an advanced and applied course in managerial economics, with introductory material in microeconomic principles. The course starts with selected principles topics such as demand and supply analysis, market equilibrium, household behavior, production and costs, and firm behavior. We then move on to more sophisticated theories of consumption and production such as demand elasticity measures, profit maximization and sensitivity analysis, price discrimination, demand estimation, theories of risk and uncertainty, market structures, and game theory. Students participate in economics games and experiments throughout the course, and examples drawn from the business and financial worlds are used to illustrate the key concepts.

EC 611(3) Course ID:011986 2019-11-01

This course is an introductory-level graduate econometrics course, focusing mainly on time-series and panel data techniques. It is entry-level in the sense that students are not presumed to have any prior acquaintance with econometrics, although they should have sufficient statistical and computing background and coursework in calculus including some optimization. Students also need to be somewhat familiar with some statistical software such as R or SAS or Python. The course attempts to serve two types of audiences. For those who wish to pursue applied data analysis in the real world, it presents a wide array of problem instances and tools appropriate for those instances. The course also serves as a stepping stone for those interested in knowing the field more intimately, introducing them to a fair amount of theory and a selection of classic and contemporary econometrics papers.

EC 652(3)Course ID:0120072018-11-08Industrial Organization in the Supply Chain[Cross-listed with EC 651] This is an industrial organization course that focuses on the strategic
interactions within the supply chain under various market conditions. Models of industry structures are
explored along with the discussion of business clusters and networks. Starting with a review of basic
microeconomics principles: other topics include horizontal and vertical integration, outsourcing, contract
negotiations and incentives, logistics issues, capacity constraints, pricing strategies and network issues
all from the perspective of the supply chain. Students apply the models covered in class through several case
studies to evolve in the art of strategic thinking.Components:Lecture

 Field Experience
 (Minimum of 20 hours) Candidates are observers in a variety of education and education-related settings.

 Apart from community and after-school programs, there must also be a range of school and classroom experiences (e.g., urban, suburban, rural; high-and low-performing schools)-all taking place at the secondary level-so that candidates have a broad experience and learn as much as possible about secondary learners and secondary education philosophy.

Literacy for the Content Classroom

[Formerly EDS 544] This course familiarizes MAT students with the necessity for and techniques of increasing student literacy (skills, attitudes, and dispositions) in each content area. Participants read background information, explore their own literacy skills, and practice applying reading and writing activities in lesson plans. Students will recognize the importance of literacy in all content areas; expand their definitions of literacy, exploring the skills and dispositions which make it possible for students to read and write for meaning for a wide variety of academic and personal purposes; explore and develop their own skills as proficient readers and writers in general and in their chosen content areas; become aware of issues of literacy through readings and discussions; become aware of how the kinds of writing assigned to students shape their thinking; develop, analyze, and integrate literacy skills in classroom lessons; integrate writing into classroom lessons in a variety of ways to stimulate and shape thinking; address NYS standards and CCSS

Effective Teaching for All Learners

[Formerly EDS 550A] Effective Teaching for All Learners at the secondary level will explore teaching and assessment for the full range of students a teacher encounters: at-risk students, special needs populations, English as a new language learners, struggling readers, disaffected learners, etc. The resources and strategies available to assist classroom teachers will be discussed and implemented. Graduate students will learn how to evaluate the effectiveness of their teaching as it relates to all their students' progress. In order to gain this understanding, graduate students will evaluate various learning assessments through the lens of different student populations, and design and evaluate a range of assessments. Awareness, empathy, and empowerment are the goals for both teachers and their students.

The Modern Teacher

ED 560(3)

[Formerly EDS 550C] This course is designed to acquaint students with current school reform issues while exposing students to the large number of digital resources, websites, strategies, software and hardware that will help them in their classroom today.

Students will be able to:

-Analyze and evaluate the school reform movement from a historical perspective.
 -Communicate more productively with students, parents and colleagues and streamline their digital workflow.
 -Differentiate instruction within their class using digital means and modern pedagogy.
 -Work cooperatively to teach their classmates about school reform and technology.
 -Design a school reform proposal using digital means.

ED 570(3)

2017-07-13

[Formerly EDS 570] This course is designed to prepare students for the teaching of grades 5 and 6. It is designed to offer students a chance to explore topics and methodology that are most appropriate for the teaching of students at the middle adolescence level. It is a course based on the theoretical and practical aspects of the teaching experience and on helping develop students into what we need today: competent, energetic and dedicated teachers at the middle level. This is a professional course which demands professional responsibility, a regular commitment, initiative and attentiveness. It is not in any way an exploratory course but one in which a commitment to teaching is assumed. This course and ED 571 qualify students with a grade 7-12 teaching certificate to be also certified to teach grades 5 and 6 in New York State.

Course ID:012797 Teaching Foreign Language to Elementary School Children

This course aims to prepare participating teachers for elementary school foreign language classrooms in light of the ACTFL National Foreign Language Standards. Through discussion, practice and the development of thematic units, participants will become familiar with the process of curriculum development and lesson planning, and will develop strategies for instruction and assessment. Participants will also gain understanding of the working environment and classroom culture of the elementary school setting and build up skills for effective teaching. Multiple modes of learning, methods, instructional strategies, language and literacy development, and resources for teaching foreign languages to elementary school children will be covered. Emphasis is on the development of literacy and communicative skills. Participants will build knowledge and understanding of this grade range through the viewing and analysis of classroom video.

Virtual Learning in the P-12 Classroom

In this online class, educators will learn how to shift course interaction and materials from the classroom to an online setting. We will explore elements that create quality online instruction including personalization, communication options and processes, student interactions, and a variety of learning experiences. The course will empower educators to build opportunities for their students to actively interact with each other, with their teacher(s), and with the content of the course.

Action Research Project

The MAT Action Research Project is a one-term research project whose purpose is to allow students time and supervision to develop breadth and/or depth of knowledge to become a better teacher in their certification field. What the project will entail varies greatly from student to student. The course is intended to be custom-tailored to meet the specific needs of an individual intern. MAT projects are well-grounded in research and theory, but also include a strong and extensive applied aspect, directly addressing the question: What would this look like in the classroom? Independent Study

2020-04-07 ED 610(3) Course ID:012316 Reflective Teaching Practices

Reflective Teaching Practices is designed to teach participants how to become reflective practitioners of their own teaching. Participants will be immersed in an exercise in evaluating their own professional practice with the goal of improving student learning. This will be accomplished by creating a supportive learning environment with teacher colleagues who wish to accomplish the same goal. Participants will critically discuss their teaching practice, and critique each other's practice through the use of videotapes. Participants will demonstrate an embodiment of the National Board for Professional Teaching Standards through the work they bring to the seminar and the manner in which they critique their own and other participants' work.

Course ID:012321 2020-06-05

This course is designed to teach the basic tenets of education law - state and federal. Constitutional principles will be explored and debated. The Socratic Method will engage students, creating a learning community in each class. Given the seminar nature of the class, it is expected the professor will explain a concept and engage students in-depth discussions every day. Real life experiences will bring the law to a practical, manageable level. This culture will allow students to challenge presumptions, question reasoning and debate ideas to grasp longstanding and newly formed legal concepts. Students will hone critical thinking and writing skills completing the course equipped to analyze problems and synthesize solutions in practical ways, with the law as their guide.

Research in Curriculum & Instruction

This course is an introductory course on research methods, designed to prepare students for graduate level research. The course examines the full scope of the research process from the literature review, to research questions, and writing a research proposal. Different data collection methods will be discussed including qualitative, quantitative, mixed-method, meta-analysis, ethnography, case study, survey, interview and focus group, and document analysis. The course culminates with presentations by students which demonstrate an understanding of the research proposal process.

Master's Thesis I

Candidates will work toward completing a master's thesis in the Spring semester, individually with guidance from a thesis advisor. The thesis will include an Introduction (Chapter I) and Literature Review (Chapter II). This course will provide guidance to complete a systematic exploration. Candidates will produce Chapters I and II by developing a research question, investigating current research, developing an informed hypothesis

in response to their question, and reviewing and synthesizing related research. Candidates will begin to

2021-08-06

2021-08-06

In this course and its predecessor, ED 650, candidates will work toward completing a master's thesis. Work

will be completed individually with guidance from a thesis advisor. Candidates will continue work begun in ED 650 by creating the final chapters of their thesis and presenting their completed work to their advisors/thesis committee. Coursework will focus on creating a Methodology or Methods of Inquiry (Chapter III), Results (Chapter IV), Discussion and Conclusion (Chapter V) and preparing a presentation of the Master' s thesis.

EE 438(3)	Course ID:010410 2015-02-23
be considered, and considered, and constant others. The impacts o	eens 5 438] The basic technology of emerging renewable or non-carbon based energy sources wil ontrasted with traditional sources of energy. Topics will include photovoltaic, wind and of energy storage and electrified transportation will be discussed. The capability of .11 be assessed, and barriers to implementation will be explored. The role of the
-	n enabling alternate energy technologies will be covered. Lecture
Attributes:	One Design Credit, Offered Even Springs Prerequisite: ES250 or permission of the instructor. Technology
EE 439(3) Dielectrics	Course ID:008147 2015-01-29
	s of materials and polarization models. Complex permittivity and relaxation spectra. 1 gases, liquids and solids. Lecture
Attributes: Req. Designation:	Offered Odd Falls Technology
EE 441(3) Electronic Devices	Course ID:008148 2020-03-20
[Cross listed with EE (BJTs) and metal-oxid SPICE device models a	541] Study of modern electronic devices, p-n junctions, bipolor junction transistors le-semiconductor field-effect transistors (MOSFETs), for integrated circuit applications are introduced, and several SPICE simulation projects are given for integrated circuit
of the microelectroni Components:	Lecture
Course Equivalents: Attributes:	Center of the second se
Requirement Group: Req. Designation:	Corequisites: ES241 or EE341 or equivalent. Technology
EE 442(3)	Course ID:011145 2020-03-20
	NOS integrated circuit design and simulation. Students will learn CMOS device models and ion and layout of digital CMOS integrated circuit blocks.
Components: Attributes:	Lecture Given When Needed
	Prerequisite: EE264. Corequisite: EE341. Technology
EE 443(3) Semiconductor Materia	Course ID:012754 2016-09-23
[Cross-listed with EE band structure modeli: processes, carrier tr	544] Fundamentals of quantum mechanics, energy band concept in crystalline materials, .ng, band structure modification, semiconductor device physics, carrier recombination cansport phenomena, lattice vibrations, advanced concepts in quantum device technology.
Components: Course Equivalents:	Lecture
Attributes:	Offered Spring Term
Req. Designation:	Technology
EE 450(3) Control Systems	Course ID:008152 2014-11-19
systems. Topics incl equations, Laplace tr sensitivity, transien	450] Introduction to the analysis and design of continuous-time feedback control ude: mathematical representation of physical systems with linear differential cansforms, transfer functions, block diagrams and signal flow graphs, feedback, ut specifications, steady-state tracking errors, stability, root locus plots, compensato
design, simulation. Components: Course Equivalents:	Lecture ME 450
Requirement Group: Req. Designation:	Prerequisites: AE/EE/ME324 or Corequisite: EE321. Technology

Engineering - Electrical & Computer Eng - Subject: Electrical & Computer Eng

EE 464(3) Course ID:008156 2020-04-20 Digital Systems Design A study of embedded microcomputer system design. Topics include CPU architecture, memory organization, interrupts, real-time operation, and interfacing with a wide range of external devices. Practical problems in digital design, testability, hardware and software trade-off analysis are covered. In addition to the technical topics, students develop teamwork skills, learn project management, system specification and documentation. Each student does both significant written documentation and oral presentations of his or her work. This course and the senior lab (EE 416) together provide both the conceptual knowledge and practical skills necessary to design application-oriented digital systems. Components: Lecture One communication unit, Offered Fall Term Attributes: Requirement Group: Prerequisites: EE316 and EE260 Corequisites: EE416 Req. Designation: Technology

2014-12-05 EE 511(3) Course ID:012016 Wireless Sensor Networks This course will present state-of-the-art wireless sensor networks. Both hardware and operating system considerations based on the OSI protocol stack will be covered. Clustering and localization techniques will be presented along with security threats and solutions. Various wireless senor network applications will be presented. Prerequisites: EE408/CS455 Computer Networks or permission of the instructor. Components: Lecture Req. Designation: Technology EE 519(3) Course ID:012948 2019-06-07 High Performance Computing Principles and practices of high-performance computing (HPC) programming, associated computer architectures, and techniques for computing performance optimization. Topics include concepts of parallel and distributed computing, multicore CPU architecture, POSIX threads programming, OpenMP (Open Multi-Processing), GPGPU (General purpose GPU) architecture, NIVIDIA CUDA programming, computer cluster management system, MPI (Message Passing Interface) programming, and case studies regarding large-scale engineering applications through HPC and computing performance improvement. Hands-on assignments utilizing Linux based open source tools and compilers will be assigned. Students must have basic C/C++ programming skills to enroll. Suitable for junior and senior undergraduate and graduate students in all engineering and computer science majors. Components: Lecture Course Equivalents: EE 561, EE 469 Given When Needed Attributes: Requirement Group: Prerequisites: EE262 or CS142, or consent of instructor. Req. Designation: Technology EE 520(3) Course ID:012790 2017-02-06 Data Driven Analysis of Complex Systems The goal of this course will be an integration of concepts of complex systems with big data analysis. Methodology will be drawn from statistical and Bayesian analysis, time-frequency analysis, image processing, linear algebra and principal component analysis, machine learning and image recognition, dimensionality reduction for dynamical systems, system identification, data assimilation, compressed sensing, and equation free modeling. Applications may include PDEs such as advection diffusion from atmospheric data and also steady flow, networked and social data-sets, feature identification in neurological applications, music analysis and identification, and image denoising. Lecture Components: Offered Fall Term Attributes: Req. Designation: Technology Course ID:011059 2016-09-23 EE 522(3) Advanced Signal Processing with Biomedical and Other Applications Statistical aspects of signal processing that includes such topics as: autocorrelation/crosscorrelation, autoregressive, moving average models, linear prediction, power spectral density, adaptive filers. Each student will utilize real data for an application from his/her research or data from a biomedical application can be provided. Each subject will be approached in three states: fundamental, advanced, and application. Class participation is critical through presentations which include: (1) journal papers for Advanced section, (2) results from their data for Application section, and (3) semester project results. Prerequisites: Programming experience in C/C++ or Matlab, basic understanding of signal processing and probability. Components: Lecture Attributes: Offered Odd Falls Requirement Group: Prerequisites: EE529 Recommended: EE401 or EE501 Req. Course ID:011744 Many-Core Architecture and Programming Model

This course will introduce students with the concepts of the state-of-the-art many-core processors. It intends to provide students with deep understandings of hardware architecture as well as the software programming model of such processors. The advanced dynamic power management features will also be covered. The students will have the opportunity to gain hands-on experience through programming a real many-core processor.

Prerequisites: EE446 or equivalent or consent of instructor. Components: Lecture Course Equivalents: EE 469, EE 519 Attributes: Offered Fall Term Req. Designation: Technology

Field Programmable Gate Arrays for Digital Signal Processing

Course ID:008199

Course ID:010463

This is an advanced project based graduate level course on embedded digital signal processing (DSP) system design using Field Programmable Gate Arrays (FPGAs). FPGAs provide a highly reliable and high performance alternative to the ubiquitous microprocessor based DSP platforms. This course introduces advanced DSP theory and algorithms and applications that can be implemented using MATLAB/Simulink blocks from leading FPGA vendors. The course will have a strong lab compenent. Students will use tools to design DSP systems using demo FPGA boards.

Components: Lecture Attributes: Offered Spring When Needed Reg. Designation: Technology

EE 563(3) Course ID:008200 2016-11-18 Instructor Consent Required Advanced Software Engineering Study of the principles and practices of software engineering. Topics include software quality concepts, process models, software requirements analysis, design methodologies, software testing, and software maintenance. Hands-on experience building a software system using the waterfall life cycle model and CASE tools. Students working in teams develop all life cycle deliverables: requirements document, specification and design documents, system codes, and user manuals. Students will learn theoretical concepts from research, such as APFD and PORT for test case prioritization, and apply these concepts to their project. Components: Lecture Offered Spring Term Attributes: Req. Designation: Technology

EE 564(3)

Enterprise Software Development

This course will examine the design, implementation, and deployment of distributed applications in the J2EE environment. Common J2EE architectures, models, technologies, and components will be discussed including RMI, SOAP, JDBC, servlets, JSP, MVC, EJB, and JMS. Students will be required to design and develop a multi-tier, enterprise application using the J2EE and a state-of-the-art J2EE application development tool. Prerequisites: EE408, CS242 or equivalent.

Artificial Intelligence: Theory and Practice [Cross-listed with CS 551] This course is an introduction to the computational study of intelligent systems. Topics include heuristic search, knowledge representation, automated reasoning, knowledge-based systems, reasoning under uncertainty, planning, and intelligent agents. Additional topics may be drawn from machine learning, neural networks, computer vision, and natural language understanding. AI programming techniques and methods will also be covered throughout the course. Prerequisites: CS344 or equivalent or consent of the instructor. Components: Lecture Course Equivalents: CS 551

2018-12-11 EE 584(3) Course ID:012920 Metamaterials This course will teach the theory and application on metamaterials. The different types of metamaterials that are covered include materials that operate in the ultraviolet, visible, infrared and microwave spectral ranges. Acoustic metamaterials are also covered. Negative index of refraction, hyperbolic metamaterials, near-zero metamaterials, cloaking materials, and light trapping structures will be studied. Components: Lecture Offered Odd Springs Attributes: Requirement Group: Prerequisite: EE583 or permission of the instructor Req. Designation: Technology EE 585(3) Course ID:011168 2014-11-20 Neural Engineering This course applies engineering principles to the study of neuroscience and to the design of devices or techniques intended to replace missing or augment existing functions such as seeing, hearing, speaking, and walking. The course provides a detailed overview of sensorimotor systems, neurophysiology, neuroanatomy, neuropathology and clinical neurology. The class sequences through the various sensory and movement systems, providing a quantitative basis for how the nervous systems works for these systems, for how it dysfunctions, for the disability produced, and finally for how function can be restored by neuroprostheses. Students will prepare and present a paper on a neural engineering topic. Prerequisites: MA132 and PH132 or PH142. Components: Lecture Course Equivalents: EE 485, BY 485, ES 485 Req. Designation: Technology EE 586(3) Course ID:012877 2018-04-26 Advanced Electromagnetics II This course will cover the second half of Balanis's book Advanced Engineering Electromagnetics. The topics covered will be waveguides and cavities, transmission lines, scattering, integral equations and method of moments, the geometrical theory of diffraction, diffraction by wedges and Green's functions. Components: Lecture Offered Fall Term Attributes: Requirement Group: Prerequisites: EE582 and PH580 Req. Designation: Technology EE 591(3) Course ID:012878 2018-05-02 Blockchain Technology: Cryptocurrencies and Beyond Blockchains, the basis of the foundational technology underpinning cryptocurrencies, offer many desirable features to end users such as anonymity, immutability, and direct, peer-to-peer transactions. There is immense interest in applying this technology to disrupt and reshape other areas such as cybersecurity, supply chains, health-care, finance & taxation, media, government & administration, and transportation. Goals of adopting this technology include minimizing fraud, providing decentralization, and maximizing efficiency, security, and transparency. This course will introduce blockchain design, including the blockchain data structure, distributed systems, consensus management, public key cryptography, hashing, transactions, smart contracts, proofs of work, and wallets. Based on this groundwork, the course will explore political, economic and social implications of blockchain technology in the context of course projects. Basic knowledge of computer programming is expected. Students from different disciplines are welcome to enroll and encouraged to Components: Lecture Attributes: Given When Needed Req. Designation: Technology EE 593(3) Course ID:013169 2022-06-02 Control and Management of Modern Electric Power Distribution System This course is the operation and control technology of modern electric power distribution systems. The selected topics will cover: the modeling & design of electric power distribution systems (overhead/underground lines, distribution transformers, and capacitor banks), technology for fault detection, isolation, and service restoration (FLISR), Volt/Var Optimization and Conservation Voltage Reduction (CVR) technologies, State Estimation for Distribution Systems, Smart Inverter/AMIs data to support grid operation, and Distribution grid impacts from Electric Vehicles (EVs). Prerequisites: EE333 or equivalent.

Engineering Statistics

[Cross-listed with CS 506, ME 577] [Formerly EER 572] Modern engineering practice makes extensive use of statistical methods for the efficient collection and analysis of engineering data, and to support data-based decision making. This course will introduce the statistical tools that are of greatest importance for practicing engineers. Core topics to be covered will include probability and distribution theory, the construction and interpretation of statistical intervals, statistical quality/process control. Additional specialized topics may also be covered, depending upon the interests of the class; possible topics include system reliability analysis, measurement system analysis, process capability analysis (and "six-sigma"), accelerated life testing, and acceptance sampling.

Components: Lecture Course Equivalents: CS 506, ME 577 Req. Designation: Technology

EE 603(3) Course ID:012971 2019-11-11 Statistical Methods for Reliability and Life Data Analysis

[Cross-listed with ME578 and BOE623]

Reliability analysis is concerned with understanding the failure modes that affect an engineered product, estimating the expected life of the product under service conditions, and predicting the failure rate of the product

as a function of time in service. The primary response variable in reliability analysis is time to failure, which may

be measured in controlled laboratory experiments, or observed empirically from post-introduction studies of products "in the field". The analysis of data for which the primary variable of interest is time to failure requires

specialized statistical concepts and tools; this course will cover some of the most useful approaches.

EE 622(3) Advanced Biometrics

This special topics graduate level course will focus on the field of biometrics. With increasing reliance on the cyber-domain, knowledge of the individual plays a vital role in trusted electronic transactions, whether they be social, professional or financial. The course will be driven by in-depth review and discussion of journal papers, as well as a semester long project. Students will explore a variety of topics within biometrics including various modalities (fingerprint, iris, face, voice, keystroke, ECG), multi-modal fusion, image processing, pattern recognition, quality assessment, vulnerabilities, social implications, and performance evaluation.

Interconnection of Distributed Energy Resources to the Power System This is a graduate level course on the topic interconnection of Distributed Energy Resources (DER) to the power system. It covers DER technology types such as PV, fuel cell, battery storage, wind, ICE, combustion turbines and others. The course shows students how to evaluate and analyze the power system impacts of DER, and determine the allowable penetration limits of DER. It deals with various interconnection issues such as voltage regulation, ground fault overvoltage, system grounding, load rejection overvoltage, overcurrent protection coordination, islanding protection, synchronization, voltage flicker, harmonics and other factors. Solutions to common problems are explained and addressed. Includes many examples and methodologies. Also covers various industry interconnection standards such as IEEE1547 and the application of various utility, federal and state interconnection protocols. Future DER trends in interconnection technology and emerging solutions are discussed as well.

Fuel Cell Science and Hydrogen Engineering

[Cross-listed with ME 581] [Formerly EER 580] Introduce the student to the science and engineering of fuel cell technology. Emphasis will be on developing an understanding of different types of fuel cells, their applications, and the engineering of complete fuel cell systems. Elements of the class will include: electrochemistry; polymer materials science for proton exchange membrane (PEM) based systems; ceramics for solid oxide fuel cells; liquid-electrolytes for phosphoric acid and alkaline fuel cells; and other methods of generating power directly from a fuel and an oxidant. They system requirements of the fuel cell stack will be introduced to provide a complete picture of the technology. Other elements addressed during the course will include thermochemistry; electrochemistry; fuel processing or reforming; electrical & power management; polymer science and systems engineering. Developing an understanding of the proton exchange membrane fuel cell will be the primary objective. After completing this course, the student is expected to have an **Components:**

Electronic Power Conversion

[Formerly EER 542] This course examines the application of power semiconductor devices to the efficient conversion of electrical energy. Circuit analysis, signal analysis, and energy concepts are integrated to develop steady-state and dynamic models of generic power converters. Specific topics include AC/DC conversion, DC/DC conversion, DC/AC conversion, and AC/AC conversion. These generic converters are applied as controlled rectifiers, switching power supplies, motor drives, HVDC transmission, induction heating, and others. Ancillary circuits needed for the proper operation and control of power semiconductor devices are also discussed. Prerequisites: Courses in circuit analysis, signals and systems.

EE 643(3) Course ID:012347 Photovoltaic Engineering

[Cross-listed with ME 582] [Formerly EER 580A] The course focuses on the physical principles, technology, and design of efficient semiconductor photovoltaics. Course goals equip students with the concepts and analytical skills to understand efficiency limitations, to assess the viability of various solar and thermophotovoltaic technologies, and to introduce the physics required for understanding photovoltaic energy conversion. The course will focus on three primary aspects of photovoltaic energy conversion, (i) the transfer and conversion of solar (i.e. thermal) radiation to electronic energy, (ii) the theory and design of the semiconductor photovoltaic cell and (iii) photovoltaic systems and applications.

EE 644(3) Course ID:012344 2016-07-01 Solid State Electronics

[Formerly EER 574] Course reviews the physics and technology of semiconductor electronic devices and their dynamic behavior. Emphasis will be placed on semiconductor devices used in high-power and high frequency applications such as power electronic switching elements and microwave power amplifiers. Course emphasizes physical understanding of device operation and limitations through energy band diagrams, electron carrier statistics and transport, charge control equations, and equivalent circuit models. Derivation of electrical characteristics and dynamic limitations will be presented for (1) power diodes, (2) bipolar devices such as the power bipolar junction transistor and thyristors, (3) unipolar devices such as the microwave field effect devices and (4) new classes of controlled power electronic devices such as the insulated gate bipolar transistor. Issues such as reduction of parasitic electrical losses, high band-gap semiconductor material development, and thermal management will be discussed. **Components:** Lecture

EE 652(3) Course ID:011279 2016-01-13 Computer Vision

[Cross-listed with CS 652] This course will cover both classical and recent progress in the field of computer vision, both on the theory and practice. Material covered will be from both the textbook and relevant research papers in the area. After taking this course, students will achieve the necessary knowledge to solve various practical computer-vision problems and build a solid background for further computer-vision research. Topics covered include: Early vision on one and multiple images (linear filters, edge detection, stereopsis), mid-level vision (segmentation, object tracking), high-level vision (model-based vision, graph-based image segmentation) and applications (medical image analysis, image-based rendering). Prerequisites: CS344 and MA339 (or equivalent, with consent from the instructor)

2016-07-01 EE 685(3) Course ID:012350

[Cross-listed as ME 587] [Formerly EER 580E] This course is designed to enable the student to effectively grasp the complex and quickly changing solar industry. The course will cover such topics as the economy of solar, photovoltaic devices, systems and applications. In order to cover this broad range of technical topics, the course will utilize multiple instructors. Each instructor has significant expertise and depth in the given field and the student will be able to draw from their experience. Students completing this course will develop knowledge of the solar industry, looking at the past, present and future of this technology area. Students will gain key technical background in every aspect of the industry and will be able to assess new technologies as they are developed. Understanding of the economics of solar and its future will also be obtained.

Components: Lecture Course Equivalents: ME 587 Req. Designation: Technology

Synchronous Electrical Generators

Solar Energy Engineering

EE 686(3)

Course ID:012351 2016-07-01

[Cross-listed with ME 589] [Formerly EER 580G] Course on fundamentals of design and analysis of power generators, such as those used in thermal power plants and wind turbines. The course will address the basic operating principles of the synchronous machine and consider configurations such as would field, permanent magnet, and doubly fed generators. Key topics will include understanding and analysis of the magnetics within the machine, losses and efficiency, thermal performance, mechanical behavior, operation on the power system, and key IEEE and IEC standards. Further topics will include the duty imposed on the machine during service as well as the duty it imposes on the turbine. The student is expected to develop a broad functional understanding of the current engineering technology, challenges, and future of generator technology.

Req. Designation: Technology
EGL 580(3) Course ID:012375 2021-10-08 MAT Project in English (Content Area) The MAT Project is a one-term research project whose purpose is to allow students time and supervision to develop breadth and/or depth of knowledge to become a better teacher in their certification field. What the project will entail varies greatly from student to student. The course is intended to be custom-tailored to meet the specific needs of an individual intern. MAT projects are well-grounded in research and theory, but also include a strong and extensive applied aspect, directly addressing the question: What would this look like in the classroom? Components: Seminar Requirement Group: Restriction: This course is open only to students matriculated in the Master of Arts in Teaching program Req. Designation: Technology
EGL 585(3) Course ID:012378 2018-01-16 Nonfiction in the English Classroom The Common Core Standards for ELA mandate a shift in the English classroom towards the use of more nonfiction/informational texts. The precise nature of this mandate and its impact on the practices of English teachers continues to be a source of controversy and confusion. In this 3-credit course, we will come to terms with this controversy, and articulate a vision for using nonfiction texts in the English classroom. Additionally, we will explore reading and writing in the literary genres that comprise the category of nonfiction, including memoir, the essay, argumentative writing, and literary journalism. Components: Lecture Requirement Group: Restriction: This course is open only to students matriculated in the Master of Arts in Teaching prog Reg. Designation: Technology

Key aspects of the course will include hazard assessment, basic anatomy and physiology associated with routes of entry and toxicology of hazardous agents, environmental, health and safety regulations, exposure monitoring instrumentation, and effective controls to minimize the risk of illness or injury. Lecture Components: Course Equivalents: BY 309 Attributes: Offered Spring Term Requirement Group: Prerequisites: CM132 or CM104/106 Req. Designation: Technology EHS 310(2) Course ID:008409 2022-01-26 Introduction to Industrial Hygiene Laboratory This is a lab course that meets for three hours a week. The course consists of weekly labs. Students must prepare lab reports on a weekly basis. These lab reports are evaluated for consistency, accuracy, presentation and overall quality. The course ends with students individually presenting scenarios that encompass knowledge gained over the length of the course. Students are expected to communicate knowledge of both environmental health and public health. In addition, each student must prepare a final report to accompany their presentation. The written material will be critiqued by the instructor and feedback will be provided to each student. A portion of the labs will be dedicated to instruction on writing and presentation skills. Components: Laboratory One communication unit, Offered Spring Term Attributes: Requirement Group: Corequisite: EHS309

Req. Designation: Technology

EHS 330(3)

Course ID:010321 Occupational Safety and Ergonomics

This course will provide students with an overview of the contemporary Environmental, Health and Safety (EHS) management techniques for occupational settings. The EHS management systems of today have evolved over many years (ISO 14001, ISO 45001). The Occupational Safety and Health Administration (OSHA) and Environmental Protection Agency are the primary regulatory organizations in the United States. However, compliance is the minimum standard of care. Cost effective systems to minimize risk among the community and workers as well as ensure compliance with state and federal regulation must include a comprehensive and integrated Environment, Health, and Safety Management System (EHS-MS) that is sustainable for the long term. The course will introduce techniques used to assess the risk of injury including job safety analysis, fault tree analysis, systems safety and design for safety . In addition, this course will provide the students with the fundamental elements of occupational ergonomic assessments, risk factors and controls. The course will be a

Course ID:013143 2022-01-26 EHS 408(1) Exposure Assessment Laboratory This class is a laboratory based course exploring human exposure. Each class (once per week, 3 hour lab) will include a 30-45 minute lecture addressing the theory and application of the laboratory material. The laboratory experiments are designed to acquaint students with a variety of environmental and occupational field sampling methods and their corresponding laboratory analytical methods. Many analytical techniques are used to analyze industrial hygiene and environmental samples. Some techniques provide immediate results while others require laboratory analysis. This course will allow the student to use a variety of methods to analyze contaminants, and an opportunity to compare and contrast sampling and analytical methods. In addition to collecting the samples, data analysis techniques and modeling exposures will be used to analyze the data with a few types of software. While the course will focus on sampling and sample analysis, related topics will be discussed briefly. Variables and conditions such as, who, when, how Components: Laboratory Course Equivalents: EHS 508 Attributes: Offered Even Falls Requirement Group: Prerequisites: EHS309, and CE433, or consent of the instructor.

EHS 416(3) Course ID:008415 2022-03-08 Principles of Toxicology and Epidemiology

[Cross-listed with BY 416] This is an introductory course in toxicology and epidemiology. Toxicology is the study of the harmful interactions, including absorption, distribution, metabolism and disease effects, of chemical, biological and physical agents with biological systems, when administered by accident or design. Epidemiology is the study of the distribution and determinants of disease frequency in populations exposed to these toxicants and stressors. The first two thirds of this course will focus on the toxicological interaction and effects of environmentally and occupationally derived toxicants with the human body. The last third of the course will focus on the epidemiological tools to evaluate the risk of exposure to such toxins, and will examine, in detail, several important historical and recent case studies of toxic exposures to individuals and populations in the home, the outdoor environment, and the work place. Toxicology and Epidemiology are important sciences that provide a sound basis for developing measures to reduce the risk of **Components:**

EHS 481(3) Course ID:008416 2022-01-26 Advanced Topics in Environmental and Occupational Health This course is a project based course that requires students to work on a broad array of topics in environmental health. Students will have multiple projects (6-8) running simultaneously and each will require writing assignments and presentations. Literature and text reviews will be necessary for most of the projects. Group communication skills are also developed as some projects are done in groups. Course work and lab preparation call for combining both lab work and lecture material in a cohesive and accessible format. The course also involves consistent review of student work by the instructor, in the form of both written and oral feedback. IH481 also requires for a minimum of three oral presentations by individuals. Components: Lecture Attributes: One communication unit, Offered Spring Term Requirement Group: Prerequisite: Senior standing in the following majors or minors: EHS or ES&P, or consent of the instru

EM 482(3) Course ID:012744 2022-02-10

Systems Engineering (SE) is an iterative process of top-down synthesis, development, and operation of real-world systems that combines technical leadership and systems management. Technical leadership is necessary for incorporating and balancing the contributions of structural, mechanical, electrical, software, systems safety, and power engineers, among others, to produce a coherent whole.Through the interdisciplinary approach of SE, systems management is focused on effectively and efficiently managing the development and operation of complex systems that result from integrating physical, smart, software, and connectivity components. Students taking this course will gain an understanding of how to create a design that considers both the business and technical needs of all customers with the goal of providing a quality product that meets customers' needs and maintain its integrity throughout its life cycle. Topics include but are not limited to fundamental concepts of systems theory and systems thinking used for SE, life cycle process

Advanced Project Management [Cross listed with OM484] This course builds on the foundation of EM/OM380 (Project Management) by introducing advanced topics in decision making, risk, and cost control as well as providing comprehensive knowledge of project scheduling and other PM tools. This course also provides an opportunity for students to further extend their PM skills in managing and controlling projects by applying the PM methods in a project management simulation using typical project management software. Students are exposed to advanced research topics in the emerging PM areas.

Operations Management and Factory Physics This course introduces the principles of manufacturing and service management while taking a cursory and scientific look at the processes and operations that impact an organization. The course exposes the student to a wide range of management terms and theories as they relate to strategic and tactical decision making. As such, it provides a basis on which to assess, evaluate, and recommend corrective management actions. In addition, focus is placed on developing an understanding of the relationship between operations and other business functions, such as marketing, finance, accounting, and human resources. Another aspect of the course is Factory Dynamics. This is the study of the factory interactions between people, equipment, raw materials and operations. It is the scientific study of how best to manage these complex interactions so the factory or operations as a whole will work effectively. Components: Attributes: Given When Needed

Introduction to Artificial Intelligence: Principles and Techniques This course will explore and discuss various theories, models, techniques and practical applications revolving around the topics of Artificial Intelligence and Machine Learning. In a rapidly changing and increasingly global economy, AI or Artificial Intelligence has become the all-powerful and an omnipresent tool/solution and is being used in some form or fashion by every industry. Artificial Intelligence is the machines which are designed and programmed in such a manner that they think and act like humans. The greatest advantage of artificial intelligence is that machines do not require sleep or breaks and are able to function without stopping. They can continuously perform the same task without getting bored or tired. When employed to carry out dangerous tasks, the risk to human health and safety is reduced. AI systems have the ability to execute tasks naturally associated with human intelligence, like speech recognition, decision-making, visual perception, and translating languages. AI would have a low error rate compared to **Components:**

Leading and Managing Organizations

Success in leading people and managing performance demands that you have an understanding of how work groups operate and what motivates employees, as well as a candid assessment of your own personality and style. The purpose of this course is to help you understand the general principles and processes of effective leadership so that you can lead in a wide variety of organizational situations. Leadership development is relevant for any student pursuing a managerial career, and is particularly relevant to students who already hold leadership positions in their organizations. Topics covered in the on-campus sessions will focus on aspects of interpersonal behavior, including personality, leadership, teamwork, and conflict management. During the online sessions we will take a more macro perspective, examining firm-level issues such as power and influence, culture, and organizational congruence.

Enterprise Sustainability

There is a growing sense of urgency around climate change and resource scarcity, and a lack of trust in the ability of global economic and political systems to solve large-scale societal environmental and social problems. Increasingly, the general public expects business to proactively contribute to solving these societal problems, striving towards making a net positive environmental and social impact on the world. Sustainability managers need to know how to lead projects, and more importantly how to help bring about a cultural change within their organizations so that ultimately sustainability is fully integrated into every function. The goal of this course is to empower managers in any function (not just sustainability managers) to lead in sustainability.

This course will provide an introduction to corporate sustainability in manufacturing companies. We will

Designation: Technology ES 110(3) Course ID:009795 2015-08-26 Engineering and Society Engineers apply scientific knowledge and principles, and use the engineering design process to develop technology. While engineers frequently develop solutions to problems in controlled environments, the products that are developed are used by 'real people' in the 'real world.' Thus, it is essential that engineers have an understanding o the interactions between engineering, technology development, and society. This course will highlight the diverse applications of engineering and technological skills in addition to ethical and other concerns about the societal consequences of technological developments. Students will gain an understanding of ways that conceptual models can be used to frame how both science and technology shape society and how society can shape science and technology. Students will be introduced to the engineering design process and use it to solve a simple engineering problem. Then, through case study, they will apply the societal models and gain an understanding of how the design process can be used to solve complex, Components: Lecture Attributes: One communication unit, Science, Technology and Society, Offered Each Term Requirement Group: Corequisites: MA 180 or equivalent. ES 380(3) Course ID:010957 2014-11-18 Special Topics: Biomechanics [Cross-listed with ME 380] This course will examine the application of engineering principles to biologic systems. The structure and function of biologic tissue will be examined in the context of engineering mechanics. Emphasis will be placed on the biomechanics of human movement, including the basic principles of orthopedic biomechanics. Students will develop the skills necessary to explore biomechanics in the contemporary scientific literature and will write a term paper on a biomechanics topic of their choice. Components: Discussion, Lecture Course Equivalents: ME 380 Requirement Group: Prerequisites: PH131 and MA132 Req. Designation: Technology

ES 432(3) Course ID:010619 2015-02-23 Risk Analysis Risk assessment entails the evaluation of the hazardous properties of substances, the extent of human exposure to them and the characterization of resulting risk. It is a systematic approach to organizing and analyzing the scientific knowledge regarding potentially hazardous activities or substances. Variability and uncertainty are used to estimate the level of confidence in the risk assessment. The general approach to risk assessment including the use of default assumptions and uncertainty analysis will be presented along with illustrative examples. Graduate Students will be required to do an additional work at the graduate level. Lecture Components: Course Equivalents: EV 532 1.5 Design Credits, One communication unit, Offered Spring Term Attributes: Requirement Group: Prerequisites: CM131 or CM103. Req. Designation: Technology

ES 436(3) Course ID:011399 2015-03-05 Global Climate Change: Science, Engineering & Policy The primary objective of the course is to provide the necessary background that will permit undergraduate students to understand and accurately describe the workings of the Earth's climate system, the interactions between the atmosphere, ocean, and climate, and human's involvement in altering these processes. The course

is broken into four primary components: earth science, energy, policy, and programming. The highly quantitative course will use project-based experiences to allow each student an opportunity to complete a data acquisition/modeling project of their own design to show correlations between human activities, current atmospheric concentrations and resulting ecosystem change. Students will use computational programming tools (Matlab) in combination with mapping tools (Google Maps API) to quantify, analyze, and display geographical variations of integrated and averaged values of quantities studied.

Prerequisites:	Quantitative and	d modeling	skills	(Matlab,	Excel)	are requi	red,	statistic	s is 1	recomme	ended.

ES 485(3) Course ID:011672 2014-11-20

[Cross-listed with EE 485, BY 485] This course applies engineering principles to the study of neuroscience and to the design of devices or techniques intended to replace missing or augment existing functions such as seeing, hearing, speaking, and walking. The course provides a detailed overview of sensorimotor systems, neurophysiology, neuroanatomy, neuropathology and clinical neurology. The class sequences through the various sensory and movement systems, providing a quantitative basis for how the nervous systems works for these systems, for how it dysfunctions, for the disability produced, and finally for how function can be restored by neuroprostheses. Students will prepare and present a paper on a neural engineering topic. Components:

[Cross-listed with CM 575, and MSE 575] The goal of this course is to provide graduate students and advanced undergraduates with a modern view of current and emerging research in nanotechnology. Topics will include: fundamental nanoscale properties and applications, green manufacturing and assembly in functional devices, interaction of nanomaterials with biological systems, the physical and chemical phenomena at nano-bio interfaces, fate, transport and transformation of engineered nanomaterials, environmental and health impact, nanometrology, nanotoxicology and hazard identification of nano-based products. Development of analytical methods and characterization tools for assessing nanoscale properties and materials will also be discussed. Students will be exposed to interdisciplinary topics and an integrated training bridging material and environmental sciences with biology and analytical chemistry. Students will be able to demonstrate a basic awareness of risks and benefits of emerging technologies and evaluate overall environmental and societal **Components:** Lecture

Sustainability Project Experience

This course prepares students for and includes a two-week intensive work/study experience at a business with a stated sustainability focus. Students will study the nature of the business and their current sustainability practices through structured class time prior to traveling. Students successfully completing this course will gain a better perspective on the technology, business, cultural and regulatory constraints and opportunities that enable the enterprise to operate in a sustainable fashion. Interdisciplinary teams of students will identify additional possible projects to creatively overcome complex, real-world sustainability challenges for the business, and complete a preliminary feasibility study that includes interdependent technical, economic and environmental considerations. Project ideas and progress will be communicated through oral presentations and progress reports throughout the semester, culminating in a presentation and report to the business staff.

EV 400(1 - 3) Course ID:008308 Environmental Science Capstone

This course is part one of a two course sequence with EV 401 that acts as the cornerstone of the Environmental Science and Policy and Environmental Health Science Programs. Each student will conduct a research project as an individual or in a group that involves several components of the scientific process. Students will be given lectures on research methods and will be required to have weekly meetings with a capstone advisor. At these meetings, work that has been completed will be evaluated and subsequent goals will be planned and established. In addition, several drafts of a final Capstone report will be written throughout the semester. The final paper is meant to be similar to the process of writing a thesis, both in scope and quality. The final presentation of this course is designed to be the culmination of a student's experience in the Environmental Science & Policy and Environmental Health Science Program, and the projects will be presented at the SURE conference or a similar type of forum.

Short Film Screenwriting
[Cross-listed with COMM 226] In this course, you will learn the process of writing short screenplays for
narrative fiction films of any genre. Short films can be anywhere from 30 seconds to 40 minutes long, though
the majority of them fall between seven and fifteen minutes. Each student will complete two short scripts and
then revise one of these from the ground up. Since this is a workshop, you are expected to comment
thoughtfully on your classmates' work, as they will comment thoughtfully on yours. Though there is some
reading in this course, your primary concern should be writing, writing, writing!

Cinemas of Resistance

2(2 - 4)

FILM

FILM Elective

FTLM 226(3)

FILM 230(3)

This course means to explore major film-making movements that fall within a category of "cinema of resistance." We will discuss concepts in and approaches to film theory and film-making that resist a Western, hetero-normative, white, and/or patriarchal discourse and will contextualize feminist and queer cinema, black cinema, postcolonial, imperfect, and third cinema, among others. We will furthermore emphasize how films are tied to the political reality of their time and pace, including major historical moments of resistance such as decolonization, the feminist movements, the Civil Rights Movement, LGBTQ rights movements, and others. While these will be our major points of discussion, we will also touch on issues like genre, spectatorship, and politics of marketing and distribution. We will watch and discuss films by filmmakers such as Vittorio De Sica, Ousmane Sembene, Julie Dash, Sally Potter, Spike Lee, Gillo Pontecorvo, and Stephen Frears, among others.

FILM 235(3) Crossing Borders

In this class, we want to take a close look at the representation of migration and border crossings in global cinema from the U.S., Canada, Germany, France, the U.K. Senegal, Nigeria, Algeria, Iran, Israel, Mexico, Argentina, and China.

2018-02-23

More often than not, conversations approach the issue of migration on a policy level, but in this class we want to take a look at how filmmakers from around the world imagine individual migrant stories and get a sense of the body of migration films that has emerged over the past three decades. Although we will certainly address policy issues, political debates, and legal frameworks, we want to focus on how cinema can create an individual humanity of migrant and refugee characters. What are the politics of representation in an unequal world order? How is the migrant humanized or de-humanized? Does a certain way of representing immigrants indicate specific national anxieties? We will discuss issues such as clandestine border crossings, migrant

2022-02-11 FILM 237(3) Course ID:012882 The Horror Film In addition to being one of the most consistently profitable film genres, horror movies also provide a window into the culture anxieties captured at the time these films were made. This course examines horror films across a variety of sub-genres over the past several decades. In addition to watching these films, students will read commentary by critics and scholars that has shaped the way we think about horror films. Students will also have an opportunity to learn the basic tools of film studies while also honing their writing abilities. Components: Lecture Attributes: One communication unit, Imaginative Arts, Offered Even Falls Req. Designation: Technology 2016-09-27 FILM 250(3) Course ID:012759 Dystopian Visions in International Cinema In this course we want to explore the representations of various forms of dystopias in international cinema and our own fascination with these ""bad"" fictional places. How might dystopian films represent and recreate societal developments and anxieties? How do filmmakers and authors respond to different socio-political contexts and concerns, such as oppressive totalitarian regimes, environmental destruction, natural disasters, and/or medical catastrophes? Finally, we will investigate issues such as religion, gender, sexuality, race, and class as they relate to dystopian scenarios. Components: Laboratory, Lecture Attributes: One communication unit, Imaginative Arts, Given When Needed Req. Designation: Technology FILM 260(3) Course ID:013137 2022-02-11 Major Marginalized Movie-Makers Using the lens of the director, or auteur, and mainly focusing on American films from the last 20 years, this class will study the productions of people who have historically been-and continue to be-underrepresented in mainstream cinema: BIPOC, LGBTQIA2+ people, and women. We will consider, for example, how directors implement their creative vision in a largely collaborative industry, as well as how directors from marginalized groups have "broken into" Hollywood. Over the course of the semester we will watch two or three films by each director and discuss not only social and cultural aspects of each film but also how to analyze theme and style across an auteur's body of work. Our primary objectives will be to consider how marginalized peoples use fictional narrative films to engage audiences with cultural and social worldviews to which they may not have been previously exposed, AND for audiences who don't often see their own cultural and social experiences reflected on screen. We might think, for example, about how Taika Waititi's vision for Thor: Ragnarock can be Components: Laboratory, Lecture Attributes: One communication unit, Imaginative Arts, Offered Even Springs Req. Designation: Technology FILM 322(3) Course ID:008590 2015-03-05 The Hollywood Cinema [Formerly LF373] The Hollywood Cinema was launched in the early part of this century when a group of New Yorkers transferred their operations to the warmth and bright natural light of Los Angeles. Since then, the Hollywood style of filmmaking has grown to be a dominant influence in world cinema. In this course, students will study the history, economics, technology and theory of Hollywood filmmaking. The course will explore the different means through which movies communicate with views, focusing on technical components such as photography, frame compositions, movement, sound, and editing, as well as more literary components such as screenplay, acting, and directing. It will explore as well the cultural components of film viewing, since the ultimate goal of the course is to gain a better understanding of the movies that both reflect and affect the lives and times of those who make and see them.

School of Arts and Sciences - Humanities & Social Sciences - Subject: Film Studies

FILM 326(3) Course ID:011955 2015-03-05

In this course, you will learn the process of writing a feature-length screenplay. You will devise an original story idea, craft intermediate documents (i.e. logline, treatment, and beat sheet), and then write a first draft. Our goal is not to complete a polished draft (most screenplays go through at least a dozen revisions), but rather to execute a full draft in proper screenplay format that hits all the dramatic turning points, fleshes out characters and dialog, and leaves you will a document ready for substantive revision - now that you know what you're writing. Since this is a workshop, you are expected to comment thoughtfully on your classmates' work, as they will comment thoughtfully on yours. Along the way, you will read several professional scripts and complete a brief critique of each. We will also learn about the profession of screenwriting, including what to do with finished scripts, how to seek representation, and what the Writers Guild of America is. Though there is a good amount of reading in this course, your primary concern should be

Film and Native America

This course focuses on the filmmaking practices of Native American and global Indigenous communities over the past 30 years. We will consider such concepts as Fourth Cinema, self-representation, authorship and genre definitions. How, for example, does Indigenous horror or documentary film have its own aesthetic and cultural concerns? Students will be introduced to both the history and theory of Indigenous cinema, from the factors motivating its emergence to the major movements and representative filmmakers. Further, students will become acquainted with aesthetic and narrative practices in Indigenous filmmaking. Although our focus will be on Turtle Island (the landmass now known as North America), we will also broaden our perspective to compare global Indigenous movements. Through the study of films by Native American and global Indigenous peoples, along with critical readings about film studies and Indigenous cultures, students will be introduced to, discuss, research, and analyze the complex nature of Indigenous cultures and societies. While the focus of

Health Sciences - Lewis School - Subject: Health Management

HC 190(4) Course ID:013125 2021-08-30

This course will provide students with the knowledge and skills necessary to care for the sick and injured in the prehospital setting as an Emergency Medical Technician (EMT). Course topics include the recognition and treatment of respiratory, cardiac, diabetic, and other medical emergencies. Environmental exposure, traumatic injuries, emergency childbirth, and psychological emergencies will also be examined. Successfully completing this course will fulfill the educational requirements for the student to take the New York State EMT certification exam. Once certified, students may utilize their skills in a variety of settings including EMS and first responder agencies, health care facilities, and to aid their own friends and family. This course will help prepare students for future healthcare studies and careers. Students planning on working or volunteering with an EMS agency will be capable of performing the job expectations of an entry level EMT safely and effectively on completion of this course.

HC 405(1 - 3) Course ID:013165 2022-04-08 Experiential Learning in Health Care

This is as an independent study course under the mentorship of a member of the Lewis School of Health Sciences faculty. This is a variable credit course (1-3cr) where 50hrs is equal to 1 credit hour. The student is required to complete at least 50 hours of work in a health profession setting. The work must include some form of interaction with health professionals and with patients or analogous health-service recipients. Examples include healthcare internships or volunteer positions at a hospital or clinic, completions of HS 210 Health Coaches II, serving as an EMT, or emergency first-responder. Conducting research with medical applications that does not involve working with patients/ health-service recipients will not meet the requirements for this course. Upon completing each 50hr experience, the student will prepare a short (around 3 page) self-reflective essay on what the student did and learned during the experience, and how the experience has affected the student's professional goals and preparation. In the essay(s), specific

HC 602(3) Course ID:012539 2017-09-29 Advanced Statistics and Data Visualization

[Formerly MBA 606] This is an applied course on advanced statistical techniques that are commonly used in health care and business settings. The course will be based on case studies that incorporate typical challenges of a real-life application: Large data sets with mixed types of variables (e.g., qualitative and quantitative), missing data, lurking variables, correlated variables and uncontrolled variation. The course objective is to enable students to become effective users of advanced statistical techniques in support of business decision making. The topics covered will include logistic regression, multivariate analysis (principal components, clustering, discriminant analysis), partitioning analysis, and time series modeling. Students will learn to identify high impact application opportunities for each technique, plan and execute their own data-based investigations, apply the appropriate statistical modeling technique, and report their findings and recommendations. The role of effective data visualization as a key element in modern data

Advanced Applications in Data Analytics The objective of this course is to introduce students to advanced data analytics applications, using a set of structured and unstructured data (historical and real-time) from various business sectors. The course will build upon concepts and methodologies, which students have learned from previous classes in the data analytics program, but extend the scope and complexity by using a combination of analytic tools (e.g. R, SPSS, RapidMiner, Tableau, and SQL). While some of the 3 day course involves lecturing and hearing guest sessions, students will spend most of their time working in a team to analyze data and prepare presentations to visualize and communicate the insights obtained from the data. This course will be focused on key-concepts in data analytics and provide students with a better understanding of how to analyze and communicate 'big data' and will provide the students in the MS Healthcare Data Analytics program a "capstone" style experience.

2022-02-11 HIST 210(3) Course ID:010880 The Ancient World This course traces the birth and development of civilization in the ancient world from the 3rd millennium BC in Mesopotamia to the height of the Roman Empire in the 3rd century AD. Students will study the cultural values, economic organization and political systems of Mesopotamia, Egypt, Greece and Rome. Students will also consider the processes of social, cultural and geopolitical change in the ancient world and critically evaluate primary sources from each area in terms of their original function, and what types of information we can glean from them. Components: Lecture Attributes: Cultures and Societies, Given When Needed Req. Designation: Technology Course ID:008519 2015-01-23 HIST 220(3) America: 1776 - 1877 [Formerly LC250] This course will survey developments in American history from the American Revolution to post-Civil War Reconstruction. Topics for special consideration will include: the American Revolution and its aftermath, the economic and political 'revolutions' of the first half of the 19th century, immigration and the opening of the West to settlement, the critical decade of the 1850's, and the Civil War and its aftermath. The focus of the course will be on the larger political and economic trends of this transformative period, but some attention will be paid to the social and intellectual developments as well. The course will alternate between lecture and discussion. A comprehensive text may be used but discussion will center on interpretive texts and primary documents. This is an entry-level course for people who want to prepare for more advanced work in American history at the upper division level. Components: Lecture Attributes: Cultures and Societies, Individual and Group Behavior, University Course, Given When Needed Req. Components: Lecture Cultures and Societies, Individual and Group Behavior, University Course, Offered Even Attributes: Falls Req. Designation: Technology HTST 230(3) Course TD:010739 2019-03-04 Science and Society This course will acquaint students with the multifaceted ways in which science and society interface in the modern world. It will discuss important developments in the history of modern science (17th

century-present). But examining the conceptual development of scientific theories is only part of the story. The course will also explore the broader institutional, cultural and political contexts of the theories in questions. It will analyze how science influenced the societies which nurtured it as well as how societal values impact the nature and practice of science. Relationships between religion and science, science and political authority as well as the social and ethical responsibility of the scientist will be explored. Students will understand science, not as a collection of disembodied ideas about the natural world, but as a historically and socially situated activity best understood in relation to the historical contexts in which it occurs.

Greek Mythology	
	IT253] This course will explore the beginnings of Greek culture through its myths,
recorded primarily is	n Homer, Hesiod, the Greek dramatists of the 5th century BCE, and by later writers of the
classical period, su	ch as Apollonius of Rhodes, the Roman poet Ovid, and mythographers such as Apollodorous.
As important as this	rich textual record is the physical evidence of ancient Greek society. Since the late
nineteenth century,	archaeological excavations of sites associated with the ancient myths have steadily
increased our unders	tanding of their meaning and significance, as well as their relationship to ancient Greek
religion and ritual.	Finally, visual representations of the figures from myth and legend, found in vase
paintings and sculpt	ures, are essential to our full comprehension of the role of myth in the lived lives of
Greeks.

Introduction to Global History

Introduction to Global History is a course that looks at global patterns through time, and attempts to see history as an integrated whole. Topics are studied in a general chronological order, but each is examined through a thematic lens, showing how people and societies experience exchanges, integration and differences. The course consists of lectures that allow exploration of these issues at either introductory levels or at a more advanced level.

HIST 322(3) Course ID:012976 2019-10-21

This course studies the history of North America-what some Indigenous peoples call "Turtle Island"- from contact to present. This course will introduce students to the historical processes that shaped Indigenous and settler history in North America. Throughout this course, students will analyse Indigenous history through a variety of historical lenses, including those of ethnohistory, environmental history, political history, and legal history.

This course will cover a variety of themes including the nature of contact between Indigenous peoples and settlers, treaties, land claims, and education.

The course explores a variety of sources for studying and engages with Indigenous-centered perspectives that challenge conventional histories of colonialism, focusing on human migrations, economic expansions, and cultural developments.

History of Women and Gender in America

Indigenous North America Post-Contact

This course focuses on the historical experiences of American women from the seventeenth-century era of colonization to the modern era (with an emphasis on the nineteenth and twentieth centuries), and it explores the role gender plays in shaping and defining American history. A separate investigation of women's experiences provides an understanding of 1) the distinct contributions of women to the American heritage, and 2) the ways in which gender intersects with race, ethnicity, class, sexuality, region, and religion in explaining social, cultural, and political developments in the United States.

HIST 343(3) Course ID:010806 2015-01-23 War in the Middle Ages

[Formerly LC392] One popular image from the Middle Ages is the brightly armored knight, charging into battle on his steed and performing brave deeds of arms. While war was a defining force in the medieval era, the picture is somewhat more complex. This course will consider European warfare from the Carolingian period to the dawn of the Renaissance, including the origins of feudalism, the Crusades, and the Hundred Years War. Using primary and secondary sources, we will look at developments in arms, armor, training, strategy, tactics, logistics, and battlefield experience. Our problem will be to determine the relationship between warfare and the economic, social, religious, and political culture of medieval Europe. Components: Lecture

This course offers an in-depth examination of the World War I of 1914-18, its causes, campaigns, and consequences. Taking into account long-term and short-term factors, the war is considered as the first truly 'modern' war with new technologies playing in a role in a conflict of truly catastrophic scale. While many of the histories of World War I focus on Western Europe, this course will consider the war in global context, provide an insight into how great power politics was changed by it, an examination of strategy and campaigns, and a consideration of scientific and technological development. Students will engage with both primary and secondary sources relating to the war including government documents, diaries, letters, artistic and literary depictions, film, as well as considering how the war has been and can be represented in various ways.

World War II was one of the pivotal events of the twentieth century, and it's legacies remain important to this day. The course will address the origins, outbreak, course, impact, and resolutions of the war. Taking a global perspective, the course goes beyond simply a study of battles and addresses all aspects of the war, from great civilian and military leaders to the common soldiers, along with social, cultural, and economic changes on the various home fronts. Students will engage with a range of primary and secondary material relating to World War II, including texts, film, novels, and material artifacts.

HIST 349(3) Course ID:008529 2016-09-08 The Cold War Era: War and Society in the Era of the American-Soviet Rivalry, 1945-1991 This course is intended to provide a general history of the Cold War, 1945-1991. We will discuss not only the evolution of the Soviet-American rivalry, but also the many smaller wars which emerged out of this larger conflict. Special attention will be paid throughout to the social, political, and cultural aspects of the Cold War. We will consider how the conflict was driven by social and political currents within the contending parties, and how the war shaped and transformed the societies that were a part of it. Course ID:012904 Experiential Learning in Medicine & Healthcare

2022-03-18

This is as an independent study course under the mentorship of a member of the Health Professions committee. The student is required to complete at least 50 hours of work in a health profession setting. The work must include some form of interaction with health professionals and with patients or analogous health-service recipients. Examples include healthcare internships or volunteer positions at a hospital or clinic, completions of HS 210 Health Coaches II, serving as an EMT or emergency first-responder, serving as an athletic trainer. Conducting research with medical applications that does not involve working with patients/ health-service recipients will not meet the requirements for this course. Upon completing the experience, the student will prepare a short (around 3 page) self-reflective essay on what the student did and learned during the experience, and how the experience has affected the student's professional goals and preparation.

HSS 310(1 - 6) Undergraduate Research

This is an opportunity to work one-on-one with a faculty member on an area of shared interest. It provides a chance to be involved in cutting-edge original research, practice research methods central to the relevant discipline, and become part of the research community in that field. The student will undertake research directed by the faculty member and related to the faculty member's research agenda, and will document the research through a formal research paper. Undergraduate research may lead to a presentation at Clarkson's RAPS conference, other academic conferences, and/or joint publication.

HST 575(3) Course ID:012907 2022-04-08 Interdisciplinary Connections of History and Multicultural Literature Framed around universal concepts of humanity (change, diversity, intolerance, ethics, creativity, freedom, and legacy), this course is designed to illustrate the interdisciplinary connections between secondary social studies and English language arts. Recognition that these key concepts span time and place, and are applicable to every period in history, will help to develop a broad understanding of the human experience, and the unity of humanity, through the study of history and multicultural literature. In addition to the historic and literature specific content of the course, other goals include development of empathy and a respect for diversity, as well as learning how to guide discussions that value different points of view. Components: Seminar Course Equivalents: EGL 575 Attributes: Given When Needed Requirement Group: Restriction: This course is open only to students matriculated in the Master of Arts in Teaching progr HST 580(3) Course ID:012477 2021-10-08 MAT Project in History (Content Area) The MAT Project is a one-term research project whose purpose is to allow students time and supervision to develop breadth and/or depth of knowledge to become a better teacher in their certification field. What the project will entail varies greatly from student to student. The course is intended to be custom-tailored to meet the specific needs of an individual intern. MAT projects are well-grounded in research and theory, but also include a strong and extensive applied aspect, directly addressing the question: What would this look like in the classroom? Components: Seminar Requirement Group: Restriction: This course is open only to students matriculated in the Master of Arts in Teaching progr HST 587(3) Course ID:012881 2018-08-02 Reel History

Reel History is an examination of themes and concepts related to the study of history. A range of historical topics across the New York state ?7?-12 social studies curriculum will be examined. Students will view and research films to analyze and evaluate the historical accuracy portrayed in film. Emphasis will be placed on determining the degree to which film can be used as a source for understanding history. Student research, presentations, and the development of curricular materials related to the use of film as a documentary evidence will be the basis of course assessments. Components: Lecture

Optimization Methods for Analytics

Course ID:011989 2017-01-24

Optimization is a structured approach to determining the best values for a set of decision possibilities given constraints and an objective expressed as a function of these decision variables. This course focuses on the design, development, and analysis of optimization models while using canned software to solve them. The students will solve a wide variety of optimization problems applicable to a wide variety of industries: manufacturing, distribution, health care, finance, marketing, etc. Students will develop optimization models using Microsoft Excel.

Prerequisites: An undergraduate course in probability and statistics, and an undergraduate course in introductory computer science or programming.

This course will enable students to gain understanding of critical components and the processes of Big Data architecture. The course will take a hands on approach, enabling students to develop critical skills by creating data processing pipelines and procedures to transform and integrate structured, semi-structured and unstructured data . The course will provide students with understanding of web service based systems architecture and best practices for deployment of scalable applications for data analytics. This class will also teach students practical fundamentals of Cloud Computing and how it relates to Big Data. The class will cover both Apache Hadoop implementation as well as usage of leading industry solutions such as Elastic MapReduce. Throughout the class students will be taught how to recognize opportunities in big data analytics and how to match those opportunities with the most appropriate big data software. Students will learn the various data formats and be taught when to utilize each one. The course will take an

2017-01-24

Although mathematical models have a long and compelling history of application in science and engineering, they are becoming increasingly important in the world of business. Some problems are well described by statistical (curve fitting models), but analyzing a business problem generates significant complexities that are often not well described by simply analyzing the historical data. In particular, to be able to answer

questions of 'what if...?' often requires an understanding of system behaviors when we specifically to to depart from previous (historical) practices. The critical contribution of these models is that they may allow the analyst to arrive at compelling insights to contribute to development of a reasoned action plan. This class will enable students to develop familiarity and facility in generating insightful models via modeling in realistic situations. Key skills to be developed include recognizing the key problem, developing a model structure for an unstructured problem, and intelligent analysis and interpretation of model results.

Recent advances in information technology, together with the growth of the Internet have resulted in an explosion of data collected, stored, and disseminated. Because of its massive size, it is difficult for analysts to sift through the data even though it may contain useful information. Data mining holds great promise to address this problem by providing efficient techniques to uncover useful information hidden in large data repositories. Awareness of the importance of data mining is becoming widespread. Industry is creating more job opportunities for people who have interdisciplinary data analytic skills. They key objectives of this course are to teach the fundamental concepts of data mining and provide extensive hands-on experience in apply the concepts to real-world applications.

Students will have opportunities to learn both domain and technical knowledge to face the big data challenges

IS 314(3) Course ID:008438 2015-06-30 Database Design & Management [Cross-listed with EM 314] This course provides the student with in-depth knowledge of database analysis, design, and implementation principles. Students who successfully complete this course will be able to use the entity-relationship data model to represent business data requirements, to translate that model into a relational schema, to normalize this schema and to build and use a relational database that implements the schema, using the Standard Query Language (SQL). Components: Lecture Course Equivalents: EM 314 Req. Designation: Technology
<pre>IS 400(3) Course ID:008436 2017-06 Process and System Analysis and Modeling Students are expected to master the fundamentals of business process analysis and application design using the traditional and agile analysis and modeling approaches. Students will learn methodologies and project management skills by completing an array of individual assignments that involve planning, design and prototyping of business application systems. A mock prototype software application based on the analysis will be developed throughout the course. Offered Fall semesters. Components: Lecture Attributes: Offered Fall Term Requirement Group: Prerequisites: IS237 or CS141 or EE261 Req. Designation: Technology</pre>
IS 415(3)Course ID:0084392016-11-08Data Warehousing for Analytics[Cross-listed with EM 415] This course covers the fundamental concepts, design, management and application of data warehouses and business/enterprise intelligence systems. Specific topics covered include the logical design of a data warehouse, the data staging area and extraction-transformation-loading process, the design, implementation and utilization of multi-dimensional data analysis systems, as well as key business/enterprise intelligence concepts, processes and techniques including knowledge discovery and exploratory analysis. Offered Fall semesters.Components:Lecture Course Equivalents: EM 415Attributes:Offered Spring Term Requirement Group: Prerequisites: IS314 or CS460/EE468 Req. Designation:Req. Designation:Technology
IS 426(3) Course ID:011274 2019-10-22 Big Data Architecture This course will enable students to gain understanding of critical components and the processes of big data architecture. The course will take a hands-on approach, enabling students to develop skills for creating data processing pipelines and procedures to transform and integrate structured, semi-structured and unstructured data. The course will provide students with an understanding of web service based systems architecture and best practices for deployment of scalable applications for data analytics. Offered Fall semesters. Components: Lecture Attributes: Offered Fall Term Requirement Group: Prerequisites: IS211, & IS314, & IS237, CS141 or EE261, or IS110 Req. Designation: Technology
IS 428(3) Course ID:008441 2016-11-08 Information Systems for Supply Chain Management This course will be focused on information systems that enable supply chain integration. Redesign of core intra and inter-enterprise business processes will be discussed in detail. Students will be introduced to and will get hands-on experience with latest technologies such as Extended Enterprise Systems. The trend of outsourcing of business and supply chain processes to distant geographical locations and its impact on business practices and strategies will be discussed in detail. Course material will be comprises of book chapters, cases, labs, and project work to apply concepts learned in the course, and to include hands-on experience with business process driven enterprise software (e.g. SAP Advanced Planner & Optimizer).

Information Systems (MBA Module) [Cross-listed with IS 606] In this course the role of information systems and information technology in managing modern information age enterprises is explored. The focus of the course is on (a) establishing the basic knowledge of information systems (b) strategic significance of information systems to various businesses and industries (c) role of information systems as a strategic weapon to compete in the global marketplace and (d) role of information systems in transforming modern business organizations. Advanced topics of enterprise resources planning and emergent visions and practices such as electronic commerce, web-based information systems, and corporate intranets and extranets are reviewed in a framework of strategic information planning. Real life cases of information systems are analyzed and discussed to reinforce the understanding of concepts introduced in the course. Prerequisites: completion of all CUSB MBA foundation requirements admission to the MBA program.

IS 642(3) Applications in Business Analytics

Course ID:013079 2021-04-21

This course provides an introduction to Big Data and Analytics and examines a set of systems and applications, which specifically are supporting the Big Data World. Students will learn the basic concepts behind data retrieval and analytics, explore and discuss the development of these systems. Data analytics applications will be applied to current business problems, to illustrate how organizations can gain a competitive advantage with the implementation and usage of such applications. Students will gain the conceptual knowledge for business analytics concepts as well as practical experience with the structural dimension for data analytics. The main focus of this course will be to collect, preprocess, analyze and present structured and unstructured data, using advanced Data Analytics software.

Designation: Technology LIT 220(3) Course ID:008566 2022-02-11 American Gods This course focuses on the gods of American literature: Emerson, Hawthorne, Douglass, Melville, Whitman, Dickinson, Twain, and Poe. These authors and the themes they wrote about run so deep in the American psyche that they seem immortal. Foremost among those themes are spirituality and American individualism, the intertwined themes of Transcendentalist literature and its legacy. We will focus primarily on the mid-nineteenth century period of the American Renaissance, the efflorescence of American literature that produced the greatest number of authors in the American pantheon. Components: Lecture One communication unit, Imaginative Arts, Offered Fall Term Attributes: Req. Designation: Technology LIT 221(3) Course ID:008567 2022-02-11 Great American Authors [Formerly LF231] This course surveys great American authors of the "long" twentieth-century. Readings include such writers as Crane, London, Pound, Fitzgerald, Hemingway, Faulkner, Ellison, and Cisneros. American Weird Fiction

This course will introduce students to that curious type of fiction known as ""weird fiction"" (also sometimes called slipstream fiction), which overlaps with a number of other genres such as science-fiction, fantasy, and horror. Weird stories often lack an explanation for the strange events they depict, and so the genre offers writers and readers a new perspective on the sometimes odd world in which we find ourselves. The course will introduce students to the most important American authors of weird fiction from the 20th and 21st Centuries, included H.P. Lovecraft, Joyce Carol Oates, Caitlin R. Kiernan, Thomas Ligotti, and Laird Barron.

Monsters in the House

To label something monstrous may be to identify a primal source of fear or to construct a social barrier, deliberately marginalizing people who do not fit into the mainstream. This course explores portrayals of the monstrous across centuries, considering how they reflect and shape social norms. Texts may include, for example, fairy tales, Disney movies, horror films, and dystopian novels.

LIT 235(3)

Science Fiction

Introduction to the genre of science fiction and, more broadly, speculative fiction as well as a survey of representative literary texts, including readings from such writers as Philip K. Dick, Margaret Atwood, Octavia Butler, and Orson Scott Card. Works of speculative fiction often serve as an allegory for, or social commentary of, existing cultural views and social structures. The genre's focus on imagining other worlds and alternative realities make it particularly well-suited for viewing our own biases, prejudices, and social assumptions through the mirror of alien cultures.

Gender and Popular Culture

This interdisciplinary multi-media course explores the ways conceptions of gender are constructed and challenged by popular culture, including literature, film, TV, and advertising. It considers the complex ways in which social perceptions of gender intersect with constructions of race, class, and sexuality to affect relations of power. It looks at pop culture not simply as entertainment but as something that contributes to collective identities and influences our ways of seeing ourselves and others, often unconsciously. And it explores means of 'talking back,' challenging dominant portrayals of gender to open up more liberating possibilities for imagining selves.

Comics of Conscience Comics of Conscience will examine graphic novels or book-length comics which raise important social and political issues. It will explore how graphic novels are built and told-we will learn to use a conceptual vocabulary so we can discuss how the graphic novel achieves its objective of obtaining the reader's attention and engagement. We will learn how to read them, how to talk about how they get made and how they work, how to understand-and how to enjoy- some of the kinds of comics and graphic novels. Emphasis in our studies will examine the co-mixing of genres within telling a visual story: we will look at journalism comics, memoir comics, realistic fiction comics, and fantasy comics. The overall objective is to learn how to read graphic novels-e.g., how to understand the way the verbal and the non-verbal/graphic work together-and how to write about them.

"Demons and Witches among Us" will help you to develop skills in reading and analyzing fiction, as well as introduce you to the fascinating world of horror fiction. We will explore the genre of ghost story or horror literature in contemporary Asian literature, including short stories, novels, and comic books. How do Asian writers utilize elements of conventional horror, and to what effect? Can horror literature be used to address important issues such as abuse of power by authoritarian regimes, conflicts between the traditional and the modern, gender discrimination, urban alienation, and environmental destruction? We will examine supernatural motifs, including ghosts, zombies, witches, demons, and psychopaths, in fiction by writers from India, China, Japan, Cambodia, Malaysia, Singapore, and Indonesia. We will investigate how horror holds power over us the reader and what is the place of horror in society. We will also discuss the various elements of fiction: character analysis, plot, use of symbols, theme, tone, and style.

African-American Literature

[Formerly LF335] This course will survey African-American novelists, dramatists, and poets of the twentieth century in their social and political context and in their own sense of their literary tradition. It will begin, however, by looking back, (to the slave narrative of Frederick Douglass for instance), before moving into the four stages, broadly speaking, of African-American literature: The Harlem Renaissance: 1915-1935 (e.g., Zora Neale Hurston, Langston Hughes, Alain Locke); The Age of Protest: 1935-1955 (e.g., Richard Wright, James Baldwin, Gwendolyn Brooks); African-American Militant Literature: 1955-1970 (e.g., Amiri Baraka, Ishmael Reed, Nikki Giovanni); and Literature by African-American Women: 1970-1991 (e.g, Alice Walker, Toni Morrison, Toni Cade Bambara, Maya Angelou). Because in the 1950s and 1960s there is a 'rediscovery' of Africa, the survey will also include such influential African writers as Chinua Achebe. The course will be conducted as an exploration, mainly in class discussions, but also in formal written analysis, Components: Lecture

Violence and Reconciliation

[Cross-listed with POL 335] While scholars have labeled the 20th century 'the century of genocide,' the past two decades have catalyzed global changes in the ways we think about peace-building and reconciliation. But reconciliation after mass conflict remains a difficult process. Can you forgive someone who has done irreparable harm to you or your loved ones? Can you reconcile -literally, return to a previous state of harmony- with someone if you never shared a harmonious relationship with that person? Is reconciling with a whole community the same as reconciling with an individual? This course examines the challenges to reconciliation after political trauma and assesses the strengths and weaknesses of major reconciliation mechanisms. Through the lens of two case studies, South Africa and Northern Ireland, and the disciplines of film, fiction, and political theory, students will compare the consequences of criminal trials, truth commissions, and informal efforts at communal healing. As a final project, the class will participate in a Lecture Components:

School of Arts and Sciences - Mathematics - Subject: Mathematics

2021-09-22 MA 120(4) Course ID:012091

Prepares students for Calculus and higher mathematics in the science, technology, and engineering majors. Topics include algebraic concepts, lines and quadratic equations; functions; exponential and logarithmic functions and equations, trigonometry and trigonometric functions, identities and equations; systems of equations and inequalities. This course will focus on illustrating these mathematical topics from pre-calculus within the context of applications taken from the sciences and engineering.

Grading for this course is done using Mastery Based Assessment.

This course is normally taken for 4 credits. However, students joining after normal add period may be directed by the Math Department Chair to take this course for fewer than 4 credits. Under these conditions

MA 456(3) Course ID:008814 2021-11-30 Cryptography

[Cross-listed with CS 456] Cryptography is the discipline which studies the making of 'secret' codes. This course will examine some of the methods of cryptography together with many surprising applications. The language of modern cryptography is primarily number theory, and various tools of number theory will be developed as needed. No background in number theory or cryptography will be necessary, but some mathematical sophistication and familiarity with proofs will be assumed. Topics will include: one-way functions, public-key cryptogystems, digital signatures, probabilistic encryption, primality testing, interactive proof systems, and methods of secret sharing. Components: Lecture Course Equivalents: CS 456 Attributes: Given When Needed

Requirement Group: Prerequisites: CS142, EE262, or EE361, and MA211. (CS344 Recommended) Req. Designation: Technology

Matrix Theory and Computations

This course presents topics in matrix theory that are useful in applications to engineering, science and other branches of mathematics. Review of linear algebra, including vector and matrix norms and canonical forms, numerical methods for linear systems (direct and iterative methods), eigenvalue problems, singular value decomposition, orthogonal projections, matrix decompositions, generalized inverses. Additional topics may include applications to least squares and optimization.

MA 579(3) Course ID:010460 2015-01-28

The motivation for this course is that optimization problems arise routinely in most applications -- from designing an airline schedule to minimize cost to designing a remediation strategy for a contaminated ground water site. In this course we will focus on numerical techniques to solve applied optimization problems of various formulations. Topics will include solutions to linear and nonlinear equations, nonlinear programming, unconstrained and constrained optimization, black-box formulations and a glance at sampling methods, an dif time allows, extra topics may include multi-objective optimization, mixed integer programming methods, and evolutionary algorithms. This course will include a computing component with MATLAB and possibly some off-the-shelf optimization packages. The objectives are (a) to become familiar with a range of optimal design formulations and techniques appropriate for those formulations, (b) to motivate the need for efficient numerical methods for optimization problems, (c) to study these methods through implementation and analysis, **Components:**

Bayesian Data Analysis

MA 581(3)

Probability

[Cross-Listed STAT585] This course will introduce both the principles and practice of Bayesian methods for data analysis. This is a hands-on course that will use MATLAB, R or other suitable software at instructor discretion. Students will learn to write their own Bayesian computer programs to solve problems relevant to engineering, biology, chemistry, physics, earth science, ecology, economics, signal processing and machine learning. Topics that will be included are parameter estimation, model selection, time series and error analysis. Prerequisites: MA383 or equivalent and familiarity with matrices; or consent of the instructor.

Fundamental components of mechanical measurement systems are studied through laboratory experiments. Tests include electromechanical instruments, circuits, actuators, controls, and data acquisition systems. First order uncertainty analysis is performed and empirical results are compared with engineering principles from material science, statics, strength of materials, rigid body dynamics and electrical science. Components: Lecture Course Equivalents: AE 201 Attributes: Two communication units, Offered Spring Term Requirement Group: Corequisites: ES220, ES222, ES223 Req. Designation: Technology ME 212(3) Course ID:008908 2020-06-12 Introduction to Engineering Design This course lays the foundation for the design curriculum of the MAE Department. Students are introduced to how to solve complex, open-ended engineering problems. Core topics covered are: the design process; engineering ethics and professional responsibilities; design for safety; mathematical and computer modeling; and written, oral and graphical communication. These topics are presented within the framework of at least two open-ended design projects which students must propose and accomplish through the completion of the preliminary design phase including a design report and presentation slides for each project. Components: Lecture Course Equivalents: AE 212, CE 212 Offered Spring Term Attributes: Requirement Group: Prerequisites: ES100 or equivalent, PH131, or permission of the instructor. Req. Designation: Technology 2022-04-13 ME 301(1) Course ID:010196 Experimental Methods This is a hands-on experimental methods course with applications in mechanical engineering. Mechanical measurement techniques focus on temperature, strain, force, pressure, fluid flow, friction and vibration. Course topics include workplace safety, test procedures, calibration, measurement uncertainty, error propagation, design of experiments, data acquisition, sampling, data analysis, and technical report writing. Components: Lecture Course Equivalents: AE 301 Two communication units, Offered Fall Term Attributes: Requirement Group: Prerequisites: ME201 or AE201 Req. Designation: Technology Course ID:008911 2016-11-02 ME 310(3) Thermodynamic System Engineering The preliminary design of thermodynamic systems made up of components such as turbines, pumps, compressors, boilers, evaporators, and condensers will be investigated. The major emphasis will be on the design of

boilers, evaporators, and condensers will be investigated. The major emphasis will be on the design of systems operating at steady-state, but start-up and transient operation will also be studied. Design work will consider actual, rather than ideal, thermodynamic systems, and account for the applicable combustion and psychrometric aspects of the system. Both individual and team work may be required. Open-ended problems on topics discussed will be assigned. Oral and written reports will be required. Some laboratory work may be required.

Special Topic: Biomechanics [Cross-listed with ES 380] This course will examine the application of engineering principles to biologic systems. The structure and function of biologic tissue will be examined in the context of engineering mechanics. Emphasis will be placed on the biomechanics of human movement, including the basic principles of orthopedic biomechanics. Students will develop the skills necessary to explore biomechanics in the contemporary scientific literature and will write a term paper on a biomechanics topic of their choice. Discussion, Lecture Components: Course Equivalents: ES 380 Requirement Group: Prerequisites: PH131 and MA132 Req. Designation: Technology

Design of Electromechanical Systems

This course will cover analog electronic design for purposes of controlling electromechanical systems, including electromechanical sensors and actuators, analog electronic design of filters, state space and classical controllers, and transistor-based servoamplifiers and high voltage amplifiers. The course has a significant laboratory component in which students are expected to design and fabricate circuits to control electromechanical systems. Implementation of digital controllers is also covered. Text Description: The Art of Electronics, Horowitz and Hill, Cambridge University Press, Second Edition, Mechatronics; An Integrated Approach, Clarence de Silva, CRC Press.

ME 405(3) Course ID:013162 2022-03-23 Geometric Dimensioning and Tolerancing

During this course, the students will be introduced to the foundational concepts of Geometric Dimensioning and Tolerancing. It will briefly review traditional coordinate dimensioning practices and then continue with the key concepts of GD&T that address the known limitations and shortcomings of coordinate dimensioning. This course will prepare students to begin thinking of design approach with regard to defining and documenting machine component's function in addition to its size and shape. This course is instructor led with many class participation examples and hands-on student exercises. After final review and student assessments, students will be exposed to 2D and 3D CAD tools and shown how to apply the lessons learned from this course, to CAD drawings.

Optimal Engineering

[Cross-listed with AE 443] An introduction to the optimal design of mechanical systems. This course involves the application of mathematical optimization techniques, including linear and nonlinear methods, to the design of devices and systems of interest to mechanical engineers. Emphasis is placed on the formulation of problems which can be solved by these techniques. Use is made of currently available optimal design computer programs.

Components:LectureCourse Equivalents:AE 443Requirement Group:Prerequisites:Req. Designation:Technology

ME 444(3) Course ID:008936 2015-02-09

Computer Aided Engineering An introduction to computer-aided des

An introduction to computer-aided design of mechanical and structural systems. The course deals with the use of commercially available computer-aided design software and hardware for the design of mechanical and structural assemblies. The production of engineering drawings using a CAD system will also be discussed. Hands-on experience is emphasized. Students entering the course are assumed to have a basic understanding of general computer usage and computer graphics in particular.

Components:	Lecture

ME 506(3) Course ID:012593 Mechanical Behavior of Materials

[Formerly MER 506] Strain relationships in elastic and plastic behavior. Metallurgical fundamentals of plastic deformation. Dislocation theory. Materials testing. Creep and metal fatigue.

Prerequisites: Calculus, Linear Algebra, Differential Equations, and Mechanics of Materials or equivalents Components: Lecture

Req. Designation: Technology

ME 507(3) Course ID:012594 2016-07-01

Design for Manufacturing

[Formerly MER 507] This course will introduce the student to the principles of design for manufacturing. The course will begin by examining modern manufacturing operations including machining, casting, forging, welding, brazing, soldering, finishing, heat treating, assembly, plastic materials processing, powder metallurgy, and specialized manufacturing processes. This section will also include electronics manufacturing, covering both through-hole technology and surface mount devices. For each manufacturing process, capabilities and limitations will be discussed and how they relate to part design and cost. Design for manufacturing, six sigma, value stream analysis, manufacturing rate, the cost of quality, process flexibility, process simulation, and process economics.

Components: Lecture Req. Designation: Technology

ME 508(3) Course ID:012595 2016-07-01

Fracture Mechanics

[Formerly MER 508] Modern theory of fracture in design. The ability to apply fracture mechanics principles to the design and analysis of engineering structures. Subjects treated include occurrence of fracture, fracture toughness, fracture resistance, and fatigue.

Prerequisites: Mechanics of Materials or equivalent Components: Lecture

Req. Designation: Technology

ME 509(3) Course ID:012596 2016-07-01 Current Approaches to Fatigue in Design

[Formerly MER 509] To provide engineering students with an understanding of fatigue mechanisms, design criteria and realistic examples to avoid and predict fatigue/durability failures in structures and components. The major emphasis of the course is fatigue of metals as applied to a variety of engineering structures and components, including both fatigue mechanisms and design applications. The course material is applicable to ground vehicles, buildings/bridges, aerospace vehicles, ships, nuclear pressure vessels, metal implants/prostheses and others. Both constant amplitude and variable amplitude fatigue life situations are considered.

ME 515(3) Course ID:008956 2014-11-20 Finite Element Methods

[Cross-listed with CE 538, MA 572] This course is an introduction to the finite element method, from a mathematical as well as a modeling and applications point of view. The basic theory and implementation will be discussed in the context of continuum problems in linear elasticity, potential flow and plate modeling. If time permits, additional applications such as structures, electromagnetics, fluid mechanics, ground water and geotechnics will also be discussed. Topics include: weak formulations and the principle of virtual work, discretization and interpolation-function selection, assembly and solution of the system equations, error estimates and accuracy assessment. When taught in conjunction with CE 438/ME 453 the course requires additional independent work for those registered for the graduate course. Prerequisites: MA232, MA339 or MA330, ES222, ES330, and the ability to program. Consent of the instructor may be used to replace some prerequisites. Lecture

ME 516(3) Course ID:012601 2016-07-01 Finite Element Methods in Engineering

[Formerly MER 516] This course provides an introduction to the finite element method with an emphasis for solving structural engineering problems. It will cover a review of matrix algebra and the solution to simultaneous linear equations. It will then lead to an introduction of the stiffness method, which will include a review of the equations from elasticity. The method will then be applied to bar and beam equations, followed by 2D plane strain equations. Modeling guidelines will then be covered, along with axisymmetric analysis and isoparametric formulations; finishing up with three dimensional analysis. Space Robotics This course establishes principles underpinning space robotics with a thorough and modern approach; chapters build from general physical foundations through an extensive treatment of control systems, perception challenges, and conservation principles in dynamics. After introducing the principles and governing dynamic equations of space robotic systems, the latter part of the course focuses on real-life applications related to space systems including space mechanics and the dynamics of space vehicles. It introduces supervised and unsupervised machine learning (ML) algorithms including implementations of ML techniques for perception challenges that can be applied to a wide range of space vehicles and robotic systems. Applications of dynamics and control theory to real spacecraft systems are also covered. After completing this course, the students will be able to apply basic robotic and machine learning techniques in space robotic systems. **Components:** Lecture **Course Equivalents:** AE 459 **Attributes:** Offered Spring Term

Prerequisites: Fluid Mechanics, Heat Transfer Components: Lecture Req. Designation: Technology 2019-09-25 ME 574(3) Course ID:012618 Numerical Heat Transfer and Fluids Flow (CFD) [Formerly MER 555] Fluids Mechanics, Heat Transfer, and Numerical Methods concurrently applied to solve problems of applied engineering. Topics include: derivation, classification, and discretization of the General Transport equations pertaining to unsteady multi-dimensional physics. Computational theory and solution methods include: explicit, implicit, Crank-Nicolson, upwinding, as well as higher order approaches. Scheme stabilities and numerical results are addressed using the von Neumann stability assessment and examination of corresponding Modifiled equations. The coupling of pressure and velocity for imcompressible flow is considered using the SIMPLE algorithm. Components: Lecture Req. Designation: Technology ME 575(3) Course ID:012619 2016-07-01 Nuclear Engineering & Technology [Cross-listed with EE 687] [Formerly MER 560] The purpose of this course is provide students of various engineering disciplines a functional knowledge of nuclear engineering principles and those most important to the design of nuclear power generation systems. The course will focus both on the nuclear reactor core as well as plant systems. The intent is that students will gain a physical understanding of nuclear engineering principles as they relate to their own filed of interest. Class participation will be highly encouraged and focused through the discussion of current events in the nuclear industry as well as proposed future nuclear technologies. Lecture Components: Course Equivalents: EE 687 Req. Designation: Technology 2016-07-01 ME 577(3) Course ID:012621 Engineering Statistics [Cross-listed with EE 602, CS 506] [Formerly MER 572] Modern engineering practice makes extensive use of statistical methods for the efficient collection and analysis of engineering data, and to support data-based decision making. This course will introduce the statistical tools that are of greatest importance for practicing engineers. Core topics to be covered will include probability and distribution theory, the construction and interpretation of statistical intervals, statistical hypothesis testing, regression analysis

and empirical modeling, statistical experimental design, and statistical quality/process control. Additional specialized topics may also be covered, depending upon the interests of the class; possible topics include system reliability analysis, measurement system analysis, process capability analysis (and "six-sigma"),

accelerated life testing, and acceptance sampling. Components: Lecture Course Equivalents: CS 506, EE 602 Req. Designation: Technology

Advanced Modeling and Simulation of Dynamic Systems This course will incorporate techniques of bond graph theory in the energy-based lumped parameter modeling of electrical, mechanical, hydraulic, magnetic, and thermal energy domains. Bond graph theory offers a unified approach to modeling dynamic energy systems and provides the tools necessary for the analysis of complex systems involving a variety of energy domains. Rather than attempt to cover all of the available analysis techniques, this course will serve to provide an underlying foundation on which to develop a thorough understanding of the interactions of energetic systems. Emphasis of the course will focus on multi-domain interaction. Components: Lecture

ME 581(3) Course ID:012624 2016-07-01 Fuel Cell Science and Hydrogen Engineering

[Cross-listed with EE 640] [Formerly MER 580] Introduce the student to the science and engineering of fuel cell technology. Emphasis will be on developing an understanding of different types of fuel cells, their applications, and the engineering of complete fuel cell systems. Elements of that class will include: electrochemistry; polymer materials science for proton exchange membrane (PEM) based systems; ceramics for solid oxide fuel cells; liquid-electrolytes for phosphoric acid and alkaline fuel cells; and other methods of generating power directly from a fuel and an oxidant. The system requirements of the fuel cell stack will be introduced to provide a complete picture of the technology. Other elements addressed during the course will include thermochemistry; electrochemistry; fuel processing or reforming; electrical & power management; and polymer science and systems engineering. Developing an understanding of the proton exchange membrane fuel cell will be the primary objective. After completing this course, the student is expected to have an **Components:**

Course ID:012625 2016-07-01

Course ID:012626

Course ID:012628

[Cross-listed with EE 643] [Formerly MER 580A] The course focuses on the physical principles, technology, and design of efficient semiconductor photovoltaics. Course goals equip students with the concepts and analytical skills to understand efficiency limitations, to assess the viability of various solar and thermophotovoltaic technologies, and to introduce the physics required for understanding photovoltaic energy conversion. The course will focus on three primary aspects of photovoltaic energy conversion, (i) the transfer and conversion of solar (i.e. thermal) radiation to electronic energy, (ii) the theory and design of the semiconductor photovoltaic systems and applications.

ME 583(3)

ME 582(3)

Turbine Engineering

[Cross-listed with EE 683] [Formerly MER 580B] Course on fundamentals of design, analysis, and technology of turbo machinery - jet engines, gas turbines, steam turbines, water turbines, and wind turbines. The course will provide an understanding of all aspects of system development: thermodynamic cycles, design-point and off-design performance; function and design of components (inlets, compressors, combustors, turbines, outlets), operational limits, and environmental concerns; structural analysis, lifting, and materials; rotor dynamics and blade aeromechanics; clearance analysis, sealing, and packing; heat transfer, blade and component cooling; starting and control; power and thrust generation; testing and instrumentation. The student is expected to develop a broad understanding of the state-of-the-art, challenges, and future of turbine systems.

ME 586(3) Welding

[Formerly MER 580D] Welding metallurgy is a technologically important field that covers a wide range of scientific disciplines. This course uses welding metallurgy as a vehicle to introduce basic and broadly applicable concepts in solid state physics, chemistry, materials science, fluid mechanics, and solid mechanics. Topics covered include welding processes, heat and fluid flow, chemical reactions, residual stresses, solidification phenomena, phase transformations, and welding defects. Special emphasis will be placed on applied engineering problems and on the behavior of structural engineering materials. Real life examples will be used to illustrate the fundamental concepts of the course. Homework assignments and a final project are required.

ME 587(3) Course ID:012629 2016-07-01

[Cross-listed with EE 685] [Formerly MER 580E] This course is designed to enable the student to effectively grasp the complex and quickly changing solar industry. The course will cover such topics as the economy of solar, photovoltaic devices, systems and applications. In order to cover this broad range of technical topics, the course will utilize multiple instructors. Each instructor has significant expertise and depth in the given field and the student will be able to draw from their experience. Students completing this course will develop knowledge of the solar industry, looking at the past, present and future of this technology area. Students will gain key technical background in every aspect of the industry and will be able to assess new technologies as they are developed. Understanding of the economics of solar and its future will also be obtained.

ME 589(3) Synchronous Electrical Generators

ME 588(3)

Course ID:012631

[Cross Listed EE686][Formerly MER 580G] This course covers fundamentals of design and analysis of power generators, such as those used in thermal power plants and wind turbines. The course will address the basic operating principles of the synchronous machine and consider configurations such as would field, permanent magnet, and doubly fed generators. Key topics will include understanding and analysis of the magnetics within the machine, losses and efficiency, thermal performance, mechanical behavior, operation on the power system, and key IEEE and IEC standards. Further topics will include the duty imposed on the machine during service, as well as the duty it imposes on the turbine. The student is expected to develop a broad functional understanding of the current engineering technology, challenges, and future of generator technology. Cross Listed EE686 Components: Lecture

Engineering - Mechanical & Aerospace Eng - Subject: Mechanical Engineering

Course ID:008972 2015-01-28 ME 633(3)

This course provides an introduction to the subject of plasticity. The physical background of inelastic deformation in metals and geological materials is discussed. Continuum constitutive theory is presented including yield criteria, flow rules, and plastic hardening. Extension to the rate-dependent (viscoplastic) material is discussed. Uniqueness and extremum theorems are derived and discussed and field equations for general, two-dimensional and axisymmetric problems are presented. Selected problems from metal and soil/rock plasticity are presented and solved using various techniques, including slip-line theory, limit analysis and exact methods. Other topics such as localization and diffuse instability in plastic deformation and application of FEM in plasticity are presented as time allows. Prerequisite: CE554 or ME554; recommended CE551 or ME551.

Req. Designation:	Technology

ME 637(3)

Course ID:008992 Particle Transport, Deposition and Removal II

Introduction to turbulent flows and turbulent modelings. One and several equation models. Drag, lift, virtual mass, and Basset forces acting on particles. Wall effects and nonspherical particles. Aerosol transport and dispersion in turbulent flows. Turbulent diffusion and wall deposition of aerosols. Particle charging mechanics and electrostatics forces. Thermophoretic and electrophoretic effects. Introduction to colloids and electrokinetic phenomena. Computational aspects of aerosol dispersion and deposition in turbulent flows. Sublayer model approach. Approximate simulation of turbulence and turbulence transport. DNS simulation methods. Nonspherical particle transport in turbulent flows. Coagulation of aerosols due to shear and tubulence. Experimental techniques for turbulent flow measurements. Hot-wire anemometry, Isokinetic sampling. Particle concentration and velocity measurements with phase-doppler, and PIV. Applications to microcontamination control, air pollution, combustor, spray, and particle deposition in human lung.

ME 639(3)

Advanced Turbulence

Review of viscous flow theory. Review of instability of viscous flows. Origin of turbulence. Phenomenological theories of turbulence. Reynolds' equation. Energy budget and vorticity dynamics in turbulence. Free shear and internal flows. Turbulent boundary layer. Introduction to turbulence modeling. The k-e and stress transport models. Recent developments in turbulence modeling, stress transport models, multipoint closure methods, and thermodynamical formulation. Turbulent diffusion, isotropic turbulence, and Karman-Howarth equation. Kraichnan's direct interaction approximation.Wiener-Hermite expansion approach. Characteristic functional formulation and Hopf's theory. Lundgren's probabilistic formulation and Chung's kinetic theory of turbulence. Direct and Large-Eddy simulation techniques. Proper orthogonal decomposition Techniques. Chaos and dynamical systems, stochastic estimation, Lagrangian approaches.

Elastic Waves in Solids			
The course concerns with stre	ss propagation problems in	elastic solids and	l waveguides. Following the
derivation of governing elast	o-dynamics equations, form	al mathematical iss	sues, such as uniqueness, reciprocal
identity, and completeness th	eorem, are addressed. The	most commonly used	solution techniques (e.g. Green's
functions, integral transform	s, normal mode expansions,	and series analysi	is) with examples are provided.
Problems considered include p	ropagation in half spaces	(refections and tra	ansmissions), approximate rod and
plate theories, and classes c	f composite materials (e.g	. laminated bars, a	and plates). Well-known experimental
techniques are also covered.	Assignments consist of mat	hematical derivation	ons, computer simulations and
presentations.			
Prerequisites: ME551/CE551 an	d ME554/CE554 or consent c	f the instructor.	

erequisites: ME551/CE551 and ME554/CE554 or consent of the instructor. Components: Lecture

Marketing Management [Cross-listed with MK 609] This course provides graduate students with a fundamental command of marketing concepts, processes, and management, as well as creating an understanding of the critical strategic role marketing plays in the management of organizations. The objectives are two-fold. The first objective is to provide the student with an introduction to the fundamental concepts of marketing and their role in effective marketing management. Thus students will explore central topics including product, price, place, and promotion decisions, examine the roles of consumer behavior and market research, and investigate how organizations blend these inter-related components to create and sustain value. The second objective is to allow students to apply that knowledge in the context of strategic marketing management. Here, strategic elements associated with marketing are integrated into strategic marketing framework to understand and develop marketing strategy and to illustrate how marketing can assist the firm in arriving at a competitive

Marketing Research Techniques

[Formerly MBA 626] Marketing research is primarily conducted to reduce the amount of uncertainty managers would otherwise face in their decision-making. This course is designed to develop students' knowledge of marketing research by both exposing them to many major important issues involved with marketing research and requiring them to complete a marketing research report from start to finish. Topics discussed include research designs, data collection methods, survey development, measurement, sampling methods and sample size determination, descriptive statistics, parameter estimation, independent samples t-test analysis, correlation analysis, chi-square analysis, code sheet development, non-sampling errors, and ethics in marketing research.

Course ID:013018 2019-11-01 MK 630(3) Marketing and Social Media Analytics The course will provide you with an introduction to marketing and social media analytics. We will study how to conceptualize and apply decision modeling to derive marketing insights from empirical data in areas such as pricing, segmentation, customer lifetime analysis, targeting and positioning, and branding. This will be a hands-on course based on the analytic approach, in which you will acquire skills to translate conceptual understanding into specific marketing plans in various decision contexts. Components: Lecture Offered Spring Term Attributes: Requirement Group: Prerequisites: IA 530 or equivalent. Req. Designation: Technology MK 640(3) Course ID:011776 2016-08-27 Marketing Management for Innovation This course introduces students to the fundamentals of marketing management including consumer behavior, market research, professional selling, and marketing strategy all with a focus on managing the innovation process. The course is designed for graduate students who have undergraduate training in a technical field, most likely engineering and need exposure to the theory and practice of marketing and thus, integrates the concept and practice of innovation throughout the topics covered.

MP 414(0 - 3) Course ID:009174 2020-03-30 Instructor Consent Required Multidisciplinary Course (Applied Robotics) Clarkson students work together with local high school students to participate in a nation-wide robotics competition and get a hands-on, inside look at the engineering profession. During the fall semester, students plan for the upcoming spring competition by participating in a series of seminars that focus on various aspects of mobile robot design and construction. Competition rules are announced at the start of the spring semester, and during an intense six-week period, students work to brainstorm, design, construct, and test their robot entry. With only six weeks of build time, all jobs are critical path. Teams from across the nation then compete in a tournament complete with referees, cheerleaders and time clocks. The competition changes each year, so returning team members always have a new challenge. Components: Project Team Attributes: Offered Each Term Req. Designation: Technology

Other - Military Science - Subject: Military Science

MS 111(1) Course ID:009194 2015-02-19

Leadership and Personal Development Introduces cadets to the personal challenges and competencies that are critical for effective leadership. Cadets learn how the personal development of life skills such as critical thinking, goal setting, time management, physical fitness, and stress management relate to leadership, officership, and the Army profession.

The focus is on developing basic knowledge and comprehension of Army leadership dimensions while gaining a big picture understanding of the ROTC program, its purpose in the Army, and its advantages for the student. Class meets weekly for one hour with a co-requisite laboratory and one weekend field training exercise. Physical fitness training is also required.

Components:Laboratory, LectureAttributes:Offered Fall TermReq. Designation:Technology

MS 112(1) Course ID:009195 2015 Introduction to Tactical Leadership

Overviews leadership fundamentals such as setting direction, problem-solving, listening, presenting briefs, providing feedback, and using effective writing skills. Cadets explore dimensions of leadership values, attributes, skills, and actions in the context of practical, hands-on, and interactive exercises. Continued emphasis is placed on recruitment and retention of cadets. Cadre role models and the building of stronger relationships among the cadets through comment experience and practical interaction are critical aspects of the MS112 experience. Class meets weekly for one hour with a co-requisite laboratory and one weekend field training exercise. MS111 recommended but not required as prerequisite; Physical fitness training is also required. No military obligation for non-contracted students.

Components:Laboratory, LectureAttributes:Offered Spring TermReq. Designation:Technology

MS 221(2) Course ID:009196 2015-02-19

Course ID:009197

Innovative Team Leadership

Explores the dimensions of creative and innovative tactical leadership strategies and styles by examining team dynamics and two historical leadership theories that form the basis of the Army leadership framework (trait and behavior theories). Cadets practice aspects of personal motivation and team building in the context of planning, executing, and assessing team exercises and participating in leadership labs. Focus is on continued development of the knowledge of leadership values and attributes through an understanding of Army rank, structure, and duties and basic aspects of land navigation and squad tactics. Case studies provide tangible context for learning the Soldier s Creed and Warrior Ethos as they apply in the contemporary operating environment (COE). Class meets weekly for two hours with co-requisite laboratory and one weekend field training exercise. Physical fitness training is also required. MS111 and MS112 recommended but not required as prerequisites. No military obligation for non-contracted students.

Components:Laboratory, LectureAttributes:Offered Fall TermReq. Designation:Technology

MS 222(2) Foundations of Tactical Leadership

Examines the challenges of leading tactical teams in the complex contemporary operating environment (COE). The course highlights dimensions of terrain analysis, patrolling, and operations orders. Further study of the theoretical basis of the Army leadership framework explores the dynamics of adaptive leadership in the context of military operations. MS222 provides a smooth transition into MS331. Cadets develop greater self awareness as they assess their own leadership styles and practice communication and team building skills. COE case studies give insight into the importance and practice of teamwork and tactics in real-world scenarios. Class meets weekly for two hours with co-requisite laboratory and one weekend field training exercise. Physical training is also required. MS111, MS122, MS221 recommended but not required as prerequisites. No military obligation for non-contracted students.

MS 331(3) Course ID:009199 2015-02-19

Adaptive Tactical Leadership Challenges cadets to study, practice, and evaluate adaptive leadership skills as they are presented with challenging scenarios related to squad tactical operations. Cadets receive systematic and specific feedback on their leadership attributes and actions. Based on such feedback, as well as their own self-evaluations, cadets continue to develop their leadership and critical thinking abilities. The focus is developing cadets tactical leadership abilities to enable them to succeed at ROTC s summer Leadership Development and Assessment Course (LDAC). Class meets weekly for three hours with co-requisite laboratory and one weekend field training exercise. Physical fitness is also required. Prerequisite: MS Basic Course or equivalent.

Components:	Laboratory, Lecture
Attributes:	One communication unit, Offered Fall Term
Req. Designation:	Technology

MS 332(3) Course ID:009200 2015-01-20

Uses increasingly intense situational leadership challenges to build cadet awareness and skills in leading tactical operations up to platoon level. Cadets review aspects of combat, stability, and support operations. They also conduct military briefings and develop proficiency in garrison operation orders. The focus is on exploring, evaluating, and developing skills in decision-making, persuading, and motivating team members in the contemporary operating environment (COE). MS332 cadets are evaluated on what they know and do as leaders is they prepare to attend the ROTC summer Leader Development Assessment Course (LDAC). Class meets weekly three hours with co-requisite laboratory and one weekend field training exercise. Physical fitness training is also required.

Prerequisite: MS Basic Course or equivalent. Components: Laboratory, Lecture

Course ID:009201

MS 441(3)

Developing Adaptive Leaders

Develops cadet proficiency in planning, executing, and assessing complex operations, functioning as a member of a staff, and providing performance feedback to subordinates. Cadets assess risk, make ethical decisions, and lead fellow ROTC cadets. Lessons on military justice and personnel processes prepare cadets to make the transition to Army officers. MS IV cadets analyze, evaluate, and instruct cadets for their first unit of assignment. They identify responsibilities of key staff, coordinate staff roles, and use situational opportunities to teach, train, and develop subordinates. Class meets weekly for three hours with co-requisite laboratory an done weekend field training exercise. Physical fitness training also required.

Components:Laboratory, LectureAttributes:One communication unit, Offered Fall TermReq. Designation:Technology

MS 442(3) Course ID:009202 2015-01-20 Leadership in a Complex World

Explores the dynamics of leading in the complex situations of current military operations in the contemporary operating environment (COE). Cadets examine differences in customs and courtesies, military law, principles of war, and rules of engagement in the face of international terrorism. They also explore aspects of interacting with non-government organizations, civilians on the battlefield, and host nation support. The course places significant emphasis on preparing cadets for their first unit of assignment. It uses case studies, scenarios, and What Now, Lieutenant? exercises to prepare cadets to face the complex ethical and practical demands of leading as commissioned officers in the United States Army. Class meets weekly for three hours with co-requisite laboratory and one weekend field training exercise. Physical fitness training also required.

[Cross-listed with CM 575, and ES 575] The goal of this course is to provide graduate students and advanced undergraduates with a modern view of current and emerging research in nanotechnology. Topics will include: fundamental nanoscale properties and applications, green manufacturing and assembly in functional devices, interaction of nanomaterials with biological systems, the physical and chemical phenomena at nano-bio interfaces, fate, transport and transformation of engineered nanomaterials, environmental and health impact, nanometrology, nanotoxicology and hazard identification of nano-based products. Development of analytical methods and characterization tools for assessing nanoscale properties and materials will also be discussed. Students will be exposed to interdisciplinary topics and an integrated training bridging material and environmental sciences with biology and analytical chemistry. Students will be able to demonstrate a basic awareness of risks and benefits of emerging technologies and evaluate overall environmental and societal **Components:** Lecture

Applications of Synchrotron and Electron Based Techniques

Course TD:012911

2022-02-03

The purpose of the course is to familiarize all students with the x-ray and electron based experimental techniques available at Brookhaven National Lab and other similar facilities. Students will be cognizant of the applications of these cutting edge facilities, and well positioned to use them in their own research. This course is suitable for graduate students, postdocs, and advanced undergrads in physical sciences and engineering, as well as students in biological, environmental, and chemical sciences who may have the interest to learn more about the techniques they may use for their research.

OM 602(2)Course ID:0090442015-07-06Decision Analysis and Supply Chain Modeling (MBA Module)In today's fast-paced competitive environment, successful managers need the ability to define business
problems, construct quantitative models and effectively utilize decision making tools. This course will
introduce students to decision analysis techniques by focusing on the development and analysis of models for
a variety of business management problems. Topics include supply chain network design, project management,
decision making under uncertainty and risk, business process management, and simulation modeling of supply
chain systems. Microsoft Excel will be used as a modeling and analysis environment to investigate a variety
of analytic techniques.
Prerequisites: completion of all CUSB MBA foundation requirements and admission to the MBA program.

Decision Analysis & Supply Chain Modeling This course introduces students to different approaches, support tools, and analytical methods for decision making in various business management situations. The objective is to develop the students' ability to define business problems, construct quantitative models and effectively utilize decision making application software. Topics such as linear programming, network modeling, project management, decision making under uncertainty and risk, queueing theory, business process simulation, and Monte Carlo simulation will be explored. Special attention will be given to supply chain modeling and applications. Microsoft Excel will be used as a spreadsheet modeling and analysis environment to investigate a variety of analytic techniques.

Business - School of Business - Subject: Operations Management

2015-08-06 OM 606(2) Course ID:009047 Supply Chain Management (MBA Module)

[Cross-listed with OM 607] Global supply chains are networks of facilities around the globe that procure raw materials, transform them into intermediate and final products, and subsequently deliver the products to customers worldwide through distribution systems. Rapid advances in information technology are accelerating productivity by providing a multitude of new, lower-cost options for integrating supply chains. In this course we review and discuss state-of-the-art concepts and practical tools to effectively design and management the supply chain. Topics covered include a strategic framework for supply chain management, supply chain design and operation, logistics strategies and design for logistics, inventory management and risk pooling, warehousing and material handling systems, supplier relations, and new and future trends in supply chain management.

Prerequisites: completion of all CUSB MBA foundation requirements and admission to the MBA program. Components: Lecture

OM 607(3)

Course ID:009048 Global Supply Chain Management

[Cross-listed with OM 606] Intense global competition has forced business enterprises to redesign and integrate their supply chains to effectively meet rising customer expectations at a reasonable cost. This course will start with selected introductory topics before covering the state-of-the-art concepts and practical tools to effectively design and manage the supply chain. Topics covered include a strategic framework for supply chain management, supply chain design, managing inventories in the supply chain, global logistics and distribution strategies, design for logistics, global sourcing, managing supply chain risk/disruptions, and new and future trends in supply chain management. Some combination of team projects, case studies, simulation games, and consulting experiences will be utilized to demonstrate real world issues, challenges and applications.

Data-driven decision making is essential to drive performance and growth in modern supply chain management. This course showcases real-life applications of data analytics (descriptive, predictive and prescriptive) in various fields of supply chain management. Students learn to define the right data set, ask the right questions to drive supply chain excellence and business value, and use the right models and tools to develop data-driven decisions. Topics include demand forecasting, retail analytics, transportation analytics fulfillment diagnostic in logistic systems, sales and operations analytics in production, and inventory and resource management. - . ²omnononta.

Offered Fall Term		
Prerequisites: IA 530 or equivalent.		
Technology		

OM 650(3)

Operations Strategy and International Competitiveness The emphasis of the course is the operations and logistics function in firms that source, produce, distribute and market in multiple nations. The management of logistics in such firms differs from its domestic counterpart along several key dimensions. First, there is the need to be able to identify and analyze factors that differ across nations that influence the effectiveness of this function. These include worker productivity, process adaptability, governmental concerns, transportation availability, culture, and so on. In addition, because of the distances involved, transportation and distribution are of greater significance. Finally, these geographically dispersed set of facilities and markets must be integrated and managed to enhance the strategy of the business unity.

OM 671(3) Supply Chain Environmental Management

Manufacturing organizations have increased their interest in environmental management through activities such as green purchasing, reverse logistics, product stewardship and design-for-the environment. These activities, usually involving several organizations, are often part of what is known as supply chain environment management. This course aims to gain a greater understanding of supply chain environmental management by examining: (i) the advantages and business risks of adopting and implementing environmental practices and technologies in the supply chain, (ii) the role of suppliers and customers to facilitate the adoption/ implementation of environmental practices and technologies, and (iii) the implications of such supply chain activities on an organization's operations strategy. This course consists of a mix of lectures and class discussion and relies primarily on a set of readings and a series of cases that will be analyzed in class.

Course ID:013103 Supply Management Strategy and Analysis

Effective supply management strategies and management enhances efficiency, customer service, and innovations, ultimately contributing to the profitability and competitive advantages of the entire organization and its supply chain. This course equips you with analytical methods and theoretical strategies to develop and implement an effective supply management strategy for your company. Specific topics include global sourcing and supply chain management strategy alignment, pricing and cost strategy, supplier network evaluation and development, contract management, and sustainable sourcing. Highly interactive format features student-led discussions and staged debates. Includes assignments on case studies and sourcing analysis, as well as projects and a final exam.

Developing and Managing Technology This course covers the creation, design, development, implementation, diffusion and transfer of product and process innovation. The course covers the full range of activities from laying a foundation of technical knowledge in research, through the creation of new products and processes, to the integration of marketing, manufacturing and engineering, to commercialization. Topics include innovation management, managing r&d, product and process development, concurrent engineering, project selection, initiating new ventures, and technology transfer. Lectures, cases, reading, and projects focus on managing technology in companies.

Strategic Project Management [Cross-listed with ES 510, OM 681] A project is a one-time or infrequently occurring operation with a unique goal, a limited lifespan and limited resources. This course will focus on project management from a decision-making perspective and how projects can be used to implement organizational strategy. The course follows the project life cycle model from project initiation to implementation to termination. Topics covered include such things as project scope development, project selection, organizational strategy, leadership, team building, planning, conflict resolution, budgeting, resource allocation, information management, control, auditing, and termination procedures. Computer applications such as MS Project, case studies, project simulations and student project teams will be an integral part of the course. This course satisfies the educational prerequisite for the Project Management Institute's (PMI) Certified Associate in Project Management (CAPM) and Project Management Professional (PMP) certifications.

OS 657(3) Course ID:009066 2016-0

[Cross-listed with OS 656] This course examines the processes of organizational change in dynamic technological and global business environments to enhance organizational quality, productivity, and overall operation. The course focuses on leadership approaches that facilitate stakeholder acceptance of change and employee contribution to the management of change. Topics include: change models and theories, the various types of organizational change, planned organizational change, resistance to change, the role of change management consultants, and human resource management practices that facilitate change. The types of change considered range from minor change interventions to transformational change, including technological, cultural, and work design changes. The course utilizes case studies, skills development exercises, and group projects in the study of organizational change.

OS 675(3) Course TD:012579 2016-07-01 Human Resource Management Systems

[Formerly MBA 675] This course covers theories, empirical research and practical applications relevant to strategic human resource management from three major perspectives: legal, management and social science. The course will provide foundational knowledge in human resource and anti-discrimination law, job analysis, and strategic human resource planning processes. Four functional areas of human resource management will be addressed: recruitment/selection, training/development, motivation (e.g., performance management, compensation/benefits) and maintenance (e.g., communications, health and safety, labor relations, corrective action/discipline).

Components: Lecture Req. Designation: Technology

OS 676(3)

Course ID:012580 Current Issues in Human Resource Management

2016-07-25

[Formerly MBA 676] This course addresses the strategic practice of human resource management from the perspective of an organizational leader striving to work strategically, ethically, and effectively with people. Current topics of importance in human resources (such as employee engagement, diversity/inclusion, work-life integration strategies, shifting employment relationships) will be addressed, discussing ways to manage human resources effectively in organizations' dynamic legal, social and economic environments. Course topics will be examined using a problem solving approach, through analyses of case studies and court cases, social science research, and federal/state/local legislation.

OT 501(4) Course ID:012048 2019-01-15

This course will provide students with a sound working knowledge of the structure of the human body with a strong emphasis on the musculoskeletal and nervous systems through the study of clinical anatomy. The relationship between structure and function will be addressed and the integration of these body systems during normal and abnormal function will be reviewed. Course structure will focus on regional anatomy and therefore will emphasize the relationship between various structures including muscles, nerves and arteries. The laboratory is designed to facilitate the study of human anatomy through the dissection of human cadavers and examination of skeletal materials and anatomical models. In addition, dissection provides students a unique opportunity to consider and discuss issues of professionalism, team-building, ethics, and death and dying.

OT 503(4) Neuroscience

Course ID:012049 2019-04-24

This course will focus on the application of neuroscience theory and clinical principles of nervous system function to behavioral outcomes in sensation, movement, perception and cognition as typically seen by rehabilitation professionals. Anatomy and function of the human nervous systems will be taught with emphasis placed on their role in development, movement and motor learning, the sensory system, cognition, perception and behavior for the purpose of understanding rehabilitation principles and intervention. Components of normal function and dysfunction of the peripheral and central nervous systems will be reviewed from the perspective of the rehabilitation specialist. Nervous system components including the spinal cord, brainstem, cerebrum and the auditory, visual and vestibular systems will be reviewed. Primary roles and functions, knowledge of the physical structures involved and the neural pathways that link systems will be reviewed. Examination of human brain specimens and anatomical models will be used both in this course and

Development and Occupational Performance Across the Lifespan

In this course, students will explore motor, cognitive and psychosocial development and age-related changes that occur from birth through older adulthood in typical individuals. Students will gain an appreciation for, and understanding of, individual and contextual factors that influence development and aging, including but not limited to biologic, social, environmental and health-related factors. They will examine the relationship between development and aging on performance skills, and apply this knowledge to gain a deeper understanding of activity demands. Students will be able to recognize the challenges that are presented when typical development does not occur or when age-related conditions negatively impact occupational performance.

Course ID:012056

Basic Science: Mental Health and Occupational Performance This basic science course provides students the opportunity to revisit the roots of occupational therapy, as students explore the role of the profession as it relates to mental health issues. Students will compare the traditional role of OT practice in this field with current trends and emerging practice as they explore the impact of mental health and psychosocial issues on occupational performance across a lifespan. Additionally, students will explore how mental health and psychosocial issues can impact all areas of practice, from pediatrics, to adult physical dysfunction, to non-traditional practice areas.

Foundations in Research Students will refine their ability to locate, evaluate, and incorporate research evidence into the practice of occupational therapy. Students will build upon research analysis and information literacy skills from prior coursework as they develop clinical questions, conduct database searches to obtain evidence, critically analyze available evidence, and determine relevancy to clinical practice. Students will review quantitative and qualitative research methodologies and designs, analyze scholarly works and assess both role established and role emergent concerns in occupational therapy profession. Students will identify an over-arching research question derived from their own area of interest and begin to examine the current body of knowledge related to their variables of interest, identify appropriate methodologies for the question. Students will work with faculty to develop a proposal from which their scholarly activity and propose a plan for their scholarly study will evolve. This course will include the development of a Critically Appraised Paper (CAP).

OT 595(2)

Course ID:012062 2019-04-03 Professional Seminar B: Inter-professional Practice and Emerging Practice

Course ID:012063

Students will explore inter-professional practice, emerging practice, and understand the crucial, unique, and vital role occupational therapists play in a variety of teams. Through the exploration of different practice areas, students will understand how occupational performance plays a key role in health and wellness, despite practice setting. Health literacy and advocacy are addressed, as students start exploring clinical questions, critically analyze available evidence, and begin learning how to convey this knowledge to clients, colleagues, and other stakeholders. This class is the second of four professional seminar classes.

Prerequisites: Successful completion of all semester 2 courses. Components: Seminar Attributes: Offered Odd Springs Req. Designation: Technology

OT 597(2)

2019-02-25

2019-09-26

This seminar provides students the opportunity to examine and discuss specialty topics related to practice. Topics are taught in modules, allowing students to explore each topic in depth. During each module, students will explore research as it applies to occupation based practice, understand ways to collect evidence in the clinic and incorporate that evidence into occupational therapy best practice, learn ways to disseminate this information to peers, colleagues, and clients, and advocate for change. Examples of concepts covered in this class may include, death and dying, cancer, social determinants of health, and driving. The course will remain fluid to allow for educational changes as the profession changes. This class is the third of four professional seminar classes.

Prerequisites: Successful completion of all semester 3 courses.

PE 315(3) Course ID:013153 2022-03-17

Introduction to Complex Networks This course will introduce the student to the new, burgeoning field of Complex Networks, their analysis and applications to everyday-life. Elementary concepts from Graph Theory, Statistical Physics and Discrete Math techniques will be taught as demanded by the material. Covered topics will include: Basic concepts from Graph Theory, Global vs. local algorithms of analysis, Erdos-Renyi Random Graph, Small-World model of Watts & Strogatz, Scale-free networks, Barabasi-Albert and Krapivsky-Redner models, Recursive scale-free models and their applications; The percolation problem and its applications to epidemic spreading, vaccination strategies, etc. and Kleinberg navigation. Designation: PH 230(3) Physics III This course introduce: mathematical framewor phenomena include: The waves, phasors; elect polarization, reflect interferometer; wave matter waves. Topics transfer mechanisms; this course serves to is strongly recommend Components: Attributes:	Technology Course ID:009267 2015-01-20 SI lics of a single particle and systems of particles, conservation laws, central force and rotational motion. Introduction to Lagrangian and Hamiltonian formulations of Lecture Offered Spring Term Prerequisites: PH132 Corequisites: MA232 Technology Course ID:012137 2016-02-22 es certain fundamental concepts of waves, optics and thermal physics, including the basic characserse and longitudinal waves, wave equation, superposition principle, interference or cromagnetic waves, Maxwell's equations? Poynting vector, radiation pressure; tion and refraction; Young's interference experiment; coherence; Michelson's thermal physics include: Temperature, thermal expansion; absorption of heat; heat first and second laws of thermodynamics; entropy. With an emphasis on problem solving, ordige the concepts developed in Physics II (PH 132) and Modern Physics (PH 231), and tecture Given When Needed
PH 221(3) Theoretical Mechanics Kinematics and dynami problem, oscillatory classical mechanics. Components: Attributes: Requirement Group: Req. Designation: PH 230(3) Physics III This course introduce: mathematical frameword phenomena include: The waves, phasors; elect polarization, reflect interferometer; wave matter waves. Topics transfer mechanisms; this course serves to is strongly recomment Components: Attributes: Requirement Group:	Technology Course ID:009267 2015-01-20 SI ics of a single particle and systems of particles, conservation laws, central force and rotational motion. Introduction to Lagrangian and Hamiltonian formulations of Lecture Offered Spring Term Prerequisites: PH132 Corequisites: MA232 Technology Course ID:012137 2016-02-22 ess certain fundamental concepts of waves, optics and thermal physics, including the basis characterize and longitudinal waves, wave equation, superposition principle, interference o cromagnetic waves, Maxwell's equations; Poynting vector, radiation pressure; theory of light, diffraction grating, X-Ray diffraction; photoelectric effect, and of thermal physics include: Temperature, thermal expansion; absorption of heat; heat first and second laws of thermodynamics; entropy. With an emphasis on problem solving, o bridge the concepts developed in Physics II (PH 132) and Modern Physics (PH 231), and ded as a PH elective to physics majors. Lecture Given When Needed Prerequisites: PH32 and MA132
PH 221(3) Theoretical Mechanics Kinematics and dynami problem, oscillatory classical mechanics. Components: Attributes: Requirement Group: Req. Designation: PH 230(3) Physics III This course introduce: mathematical framewor phenomena include: Th waves, phasors; elect polarization, reflect interferometer; wave matter waves. Topics transfer mechanisms; this course serves to is strongly recommend Components: Attributes:	Technology Course ID:009267 2015-01-20 SI lics of a single particle and systems of particles, conservation laws, central force and rotational motion. Introduction to Lagrangian and Hamiltonian formulations of Lecture Offered Spring Term Prerequisites: PH132 Corequisites: MA232 Technology Course ID:012137 2016-02-22 es certain fundamental concepts of waves, optics and thermal physics, including the basic characserse and longitudinal waves, wave equation, superposition principle, interference or cromagnetic waves, Maxwell's equations? Poynting vector, radiation pressure; tion and refraction; Young's interference experiment; coherence; Michelson's thermal physics include: Temperature, thermal expansion; absorption of heat; heat first and second laws of thermodynamics; entropy. With an emphasis on problem solving, ordige the concepts developed in Physics II (PH 132) and Modern Physics (PH 231), and tecture Given When Needed
PH 221(3) Theoretical Mechanics Kinematics and dynami problem, oscillatory classical mechanics. Components: Attributes: Requirement Group: Req. Designation: PH 230(3) Physics III This course introduce mathematical frameword phenomena include: The waves, phasors; elect polarization, reflect interferometer; wave matter waves. Topics transfer mechanisms; this course serves to is strongly recomment Components: Attributes: Requirement Group: Req. Designation: PH 231(3)	Technology Course ID:009267 2015-01-20 SI Si of a single particle and systems of particles, conservation laws, central force and rotational motion. Introduction to Lagrangian and Hamiltonian formulations of Lecture Offered Spring Term Prerequisites: PH132 Corequisites: MA232 Technology Course ID:012137 2016-02-22 ess certain fundamental concepts of waves, optics and thermal physics, including the basis cansverse and longitudinal waves, wave equation, superposition principle, interference of the romagnetic waves, Maxwell's equations; Poynting vector, radiation pressure; tion and refraction; Young's interference experiment; coherence; Michelson's theory of light, diffraction grating, X-Ray diffraction; photoelectric effect, and of thermal physics include: Temperature, thermal expansion; absorption of heat; heat first and second laws of thermodynamics; entropy. With an emphasis on problem solving, obvidge the concepts developed in Physics II (PH 132) and Modern Physics (PH 231), and thed as a PH elective to physics majors. Lecture Given When Needed Prerequisites: PH132 and MA132 Technology
PH 221(3) Theoretical Mechanics Kinematics and dynami problem, oscillatory classical mechanics. Components: Attributes: Requirement Group: Req. Designation: PH 230(3) Physics III This course introduce mathematical framewor phenomena include: The waves, phasors; elect polarization, reflect interferometer; wave matter waves. Topics transfer mechanisms; this course serves to is strongly recomment Components: Attributes: Requirement Group: Req. Designation: PH 231(3) Fundamentals of Moder	Technology Course ID:009267 2015-01-20 SI SI SI and rotational motion. Introduction to Lagrangian and Hamiltonian formulations of Lecture Offered Spring Term Prerequisites: PH132 Corequisites: MA232 Technology Course ID:012137 2016-02-22 ess certain fundamental concepts of waves, optics and thermal physics, including the basic the necessary to describe the associated physical phenomena. Specific topics of waves arasverse and longitudinal waves, wave equation, superposition principle, interference o romagnetic waves, Maxwell's equations? Poynting vector, radiation pressure; theory of light, diffraction grating, X-Ray diffraction; photoelectric effect, and of thermal physics include: Temperature, thermal expansion; absorption of heat; heat first and second laws of thermodynamics; entropy. With an emphasis on problem solving, o bridge the concepts developed in Physics II (PH 132) and Modern Physics (PH 231), and led as a PH elective to physics majors. Lecture Given When Needed Prerequisites: PH132 and MA132 Technology Course ID:009268 2022-06-07

Physical Models of Living Systems This course focuses on modeling essential processes in living systems using the tools and techniques of physics, including computer modeling. Using case studies in virus dynamics, bacterial genetics and naturally evolved cellular circuits, the course will explore how living organisms use physical mechanisms to gain information about their surroundings, process information and make decisions. It will also examine some of the cutting edge techniques used by scientists at the forefront of biophysical and life sciences research to study living organisms and understand their behavior. This course is broadly aimed at students studying in physics, chemistry, mathematics, computer science, chemical engineering, and biomedical engineering, in addition to biology majors with advanced math classes.

PH 327(1 - 3)	Course ID:009278 2022-06-07
Experimental Physics	
matter physics and op and random uncertaint the mean; variance, c functions; confidence coefficients of corre applications. Compute	from the fields of atomic physics, electricity and magnetism, thermal physics, condens otics. A major component of the course involves statistical analyses of experimental da ties. The topics of data analysis include: Standard deviation and standard deviation of co-variance and Schwarz inequality; weighted averages, histograms and distribution e limit; least-squares fitting, uncertainties in slopes and intercepts, error-bars, elation and determination, chi squared test; general formula of error propagation and : er based graphing and data analyses are routinely used throughout the course. Elements search papers are practiced in the laboratory reports.

Philosophy and Contemporary Issues This course introduces students to philosophy and philosophizing by using philosophical concepts and methods to examine contemporary issues. For example, a society's practices regarding crime and punishment rest on its beliefs about human freedom and responsibility, and philosophical discussions of determinism provide a vantage point from which to critically evaluate these beliefs. Other issues -- such as the possibility and implications of artificial intelligence, the legitimacy of religious beliefs, the morality of torture, and the paradoxes of democracy (for example, people who are rational managers of their time may not spend the time necessary to be informed citizens) -- can be evaluated on the basis of philosophical accounts about knowledge, religion, the basis of morality, and the nature of the state.

PHIL 222(3) Course ID:012119 2015-09-29 Philosophy for Life

[Cross-Listed as LIT 222] In this course, we will learn to think philosophically (which is to say: critically, rigorously, and reflectively) about complex and difficult questions. We will study practical life philosophies from both the Eastern and Western traditions, from the Tao Te Ching to Marcus Aurelius, and from Plato to the Dalai Lama. We will reflect on the ontological, epistemological, rhetorical, and ethical perspectives of each of these philosophers and schools of thought. We will note striking similarities and important distinctions between them. Ultimately, we will reflect on our own life philosophies as well—each of us refining our personal life philosophy through reading, reflection, and discussion of these classic texts from the wisdom literature tradition.

PHIL 243(3) Course ID:010382 2021-05-21 Business Ethics 2021-05-21 2021-05-21

[Formerly LP243] This course introduces students to ethical issues in business and the ethical concepts, theories, and methods they can apply to them. There are numerous examples of unethical behavior on the part of individual businesspersons, departments, and entire business organizations. Some of these are big enough to make the news media, but most are ethical missteps that negatively impact managers, employees, and customers without making the headlines. This course explores the causes and characteristics of ethical issues and problems in business, as well as ways to resolve them. Topics will include: Foundational theories about what makes an ethical decision correct. The role of such ethical theories in business. A decision procedure for thinking about and resolving ethical issues in business. Practice in applying the ethical theories and decision procedure to cases about issues such as honesty in business, fair and equitable treatment of employees, the environmental responsibilities of business, product safety, doing business in other countries, **Components:** Lecture

Politics, Decisions and War

The main objective of this course is to inquire into the causes of war. Following critical engagement with traditional theoretical approaches to the question of conflict and cooperation in international politics, students will be introduced to systemic, group, and individual-level explanations of war, as well as to case study discussions regarding the influence of these factors. The course provides students with a set of tools for the analysis of classic and contemporary civil and international conflicts and strives to show how evidence and theory can be effectively used in understanding peace and conflict. The course draws on a wide range of disciplines, including international relations, political theory, social psychology, economics, and environmental studies. By the end of the term, students should be able to understand the main factors that drive war, as well as to outline solutions for preventing them.

This class is an introduction to the politics and governments of the countries that comprise the American continents and the Caribbean. It will focus predominantly on the Spanish & Portuguese-speaking countries in Mexico, Central & South America, and the Caribbean. It also may address relationships between or among Latin American countries and the United States and Canada. The course will address the region's political history, including periods of authoritarian rule, revolution and democratization. It also will examine the causes and consequences of these countries' institutional design, as well as the challenges to economic and political development they face, such as crime and corruption. Additionally the course will evaluate policy failures and successes from agrarian and land reform to economic development and wealth redistribution. Components: Lecture

Politics in the Americas

POL 333(3)

Course ID:012935 2019-03-08 Latin American politics & Society through Cinema

This class is a course about Latin American politics and society through the use of film and literature. It is neither a critical film course, nor a course about the use of film in politics.

This course does not offer a broad overview of the politics of Latin America, but rather explores in greater depth particular political and social issues that popular films from around the world have brought to light. As many of these films have made their way to the United States (several have been entrants or winners in the Best Foreign Language Film category of the Academy Awards), they have raised global awareness of these issues. However, films that achieve success, particularly at an international level, often focus on very dramatic issues. As such, please be conscious that this course does not offer a comprehensive portrayal of Latin America. Nevertheless, we deal with very important and influential issues in Latin American political

War-Making and World Order

A relatively small number of states have been responsible for an overwhelming number of wars over the last century. States that are engaged in security competitions and are active in the security sphere tend to shape the conflict space based on innovation in technology, the type of adversaries they are facing, and the nature of their regional and global ambitions. In this class a set of complex questions are address. The questions include: 1) how security competitions between states affects states' war-making capacity which includes technological innovation and institutional efficiency and its polity; 2) how changes in state capacity affects the probability of major and minor wars; and 3) how such wars along with escalating tensions changes regional and world orders. The course draws on scholarship in conflict processes and international relations theory and also considers major case studies that include the rise of China and the global response to the same. To understand global security competitions and conflict, it is important for students to be able to

Violence and Reconciliation

[Cross-listed with LIT 335] While scholars have labeled the 20th century 'the century of genocide,' the past two decades have catalyzed global changes in the ways we think about peace-building and reconciliation. But reconciliation after mass conflict remains a difficult process. Can you forgive someone who has done irreparable harm to you or your loved ones? Can you reconcile -literally, return to a previous state of harmony- with someone if you never shared a harmonious relationship with that person? Is reconciling with a whole community the same as reconciling with an individual? This course examines the challenges to reconciliation after political trauma and assesses the strengths and weaknesses of major reconciliation mechanisms. Through the lens of two case studies, South Africa and Northern Ireland, and the disciplines of film, fiction, and political theory, students will compare the consequences of criminal trials, truth commissions, and informal efforts at communal healing. As a final project, the class will participate in a

Happiness: Politics, Policy, and More

[Cross-listed with POL545] The U.S. Constitution argues for the rights of "life, liberty, and the pursuit of happiness." What makes us happy? Should we be happy? Why might happiness be critical to democracy? How do political decisions make us happy? Should happiness be a political goal? That said, this course will go well beyond politics and political science. It is explicitly multi-disciplinary in nature: we will study the question of happiness from disciplines based in the sciences, humanities, and social sciences, and we will study material informed by psychology, public policy, economics, biology, medicine, philosophy, literature, and film.

Topics include: theories of gender and politics; intersectionality; the public / private divide; the construction and maintenance of gendered political interests; friction between feminism and multiculturalism in both the developed and developing worlds; issues surrounding the promotion of women's rights; women as political candidates; and women as office-holders. Components: Lecture Attributes: One communication unit, Contemporary and Global Issues, Given When Needed Req. Designation: Technology POL 360(3) Course ID:013063 2020-10-15 Politics of Pandemics Pandemics act as major shocks to regional and international system(s) and have the potential to change global power distribution, initiate new technological advancements and reshape domestic politics. In other words, pandemics can shape politics and the course of history. Likewise, politics and public policies affect pandemics from their geographic scope to their social and political costs. This course delves into the relationships between domestic and global institutions and politics and pandemics. Students will study how pandemics affect political behavior at different levels of analyses. Students learn about how national and subnational politics evolve in different countries on account of global shocks from pandemics, such as HIV/AIDs, H1N1 (Swine Flu), and COVID-19. Students also will explore how pandemics shape international aid programs and investigate who benefits from such programs. During the course, students will read and analyze literature on why states act through international organizations, such as the World Health Organization, and

POL 370(3) Course ID:011997 2015-01-28 Close and Contested Elections

Course material includes the study of electoral rules worldwide, including social and political consequences of these rules. The first section of this course examines the role of elections in both democratic and non-democratic systems. What are elections intended to accomplish? How do they work? The second, longer, section of the course turns to a series of case studies of contemporary close and contested elections in a number of different contexts, including cases ranging from the United States (2000) to Iran (2009). This latter portion of the course addresses such questions as (1) the tools and procedures that various kinds of states/regimes have for dealing with such contestation, (2) the extent to which such contested elections may de-legitimize the entire political system, and (3) the role of the media. The final week addresses international election monitoring bodies. Components: Lecture Attributes: One communication unit, Contemporary and Global Issues, Given When Needed

POL 380(3) Course ID:010800 2015-01-21

This course explores the relation between law, ethics, and new technologies. In particular, we will be exploring issues of the right to privacy, abortion, state sterilization programs, cloning, rights of surrogate parents, doctor/patient confidentiality, the right to die, new definitions of death, the human genome project and intellectual property rights, and organ transplantation. This inquiry will be guided by the question: 'Who Owns Life?' There is no definitive answer to this question offered by the American court system. Through readings and discussions students will gain political and ethical perspective on how legal standards are formed in response to new demands by the public and government, and how new ethical questions are inspired by innovations in germline bioengineering, medical and rehabilitative technology, robotics, virtual reality, and nanotechnology. The material for the course will be case law and articles by leading scientists, physicians, ethicists, and legal scholars in this young field. Components: Lecture

Terrorism and Insurgencies

This course will focus on terrorism as political violence carried out by non-state actors, although we will also explore the topic of state sponsorship of terrorist groups. The purpose of the course is to familiarize students with the theoretical approaches to and contemporary challenges in the study of terror and terrorism. Topics will include the nuances involved in defining terrorism; the political context in which terrorist groups emerge; the ideologies, motivations, organizational structure, and decision-making processes of important terrorist groups; the effectiveness of various counter-terrorism tools; and the role of technology in the evolution of terror and terrorism. The course will provide a basis for discussing and analyzing contemporary terror/terrorist events and related security issues.

Course ID:011037

Special Topic: American Politics in Comparative Perspective In what ways is the United States an outlier among western democracies, and in what ways does the United States resemble other democratic nations? To the extent that the United States is distinctive, what explains the differences between the United States and other advanced industrial societies? What do the structural differences of the American political system mean for democratic performance? Is the American way more or less effective than comparably developed states in Asia, Latin America, North America, or Europe? In order to explore these questions, this class examines major features of American democracy - political culture and public opinion, electoral institutions and behavior, interest groups, political parties, and social movements, the division of power between state and federal governments - from a comparative perspective. Understanding American politics in the twenty-first century requires moving beyond national boundaries and situating the United States and its interventions in the world.

POL 471(3) Energy Policy

Energy policy is a critical component of state and national public policy. Issues surrounding the reliability and security of energy supplies directly affect national domestic and foreign policy, as well as state level environmental, economic development, and land use concerns. Via emphasis on specific issues unique to North American energy policy (US and Canada), the class will introduce students to the major theoretical frameworks used by political scientists, sociologists, economists, and other intellectual disciplines to understand how societies design and implement public policies related to energy, and how the energy industry responds. Topics covered will include theories of the state, monopoly and regulation, public choice, organizational behavior, international agreements, and innovation. The class will apply these theories to major current and historical issues in energy policy, such as ethanol, climate change, and renewable energy systems, nuclear power, energy efficiency, energy security, the world oil market, and OPEC, electricity production and markets **Components:** Lecture

POL 575(3) Course ID:011766 2020-08-01 Environmental Law

[Cross-listed with EV 575] In this course we will be examining the relationship between the Courts and various policies, laws, and regulations pertaining to the restoration and management of the environment. The central issues in the cases we will be examining emerge from the tension between property rights and what has been conceived as a constitutional right to a clean, healthy environment. Areas where this tension plays out include: the Clean Air Act, the Clean Water Act, The Superfund Law, and the National Environmental Policy Act. In general, the course is designed to help students assess whether environmental laws provide us with a route for attaining ecological goals, and to think critically about the role of the Courts as a defender of the environment. Graduate students are required to perform additional assignments above those required by undergraduates.

<u> Health Sciences - Physical Therapy - Subject: Physical Therapy</u>

2015-02-20 PT 506(2) Course ID:010621 Professional Foundation for Physical Therapy

This course assists the student in an exploration of the structure of the health care system and the evolving role of the physical therapy profession as a primary participant. The course integrates topics such as history, ethics, politics, sociology, and economics, using seminal articles from a variety of healthcare fields to broaden the learning experience. Utilizing a largely discussion-based format, each student and faculty member will have the opportunity to facilitate interaction by drawing from assigned readings, clinical examples, and students' life experiences. This course will be integrated with case discussions in PT 505 and will provide the foundation for growth as a professional throughout the physical therapy curriculum and beyond.

Prerequisite: Admission to graduate physical therapy professional curriculum (DPT). Components: Lecture Offered Fall Term Attributes: Requirement Group: Corequisites: PT505 and PT508. Technology

Req. Designation:

PT 508(1) 2019-06-07 Course ID:010622

Literature Critique and Review

Cardiopulmonary-Exercise Science

This course provides students with foundational concepts of evidence-based practice (EBP), and skills for critical evaluation of physical therapy research literature related to both background questions (e.g., risk factors) and foreground questions (e.g., interventions). Students will contrast and critique different types of intervention research and relate to levels of evidence. Students learn how to search for, identify, obtain, analyze and summarize appropriate literature using appropriate tools such as PubMed, PEDro, PTNow, and clinical practice guidelines. The capstone project is a literature review poster presentation.

PY 268(3) Course ID:013119 2021-08-26 Diversity Science

This course introduces the links between diversity and psychological processes at individual and interpersonal levels. The study of diversity in this course includes an understanding of the presence of, as well as the problems and issues associated with social and cultural differences in our society. The topics of this course cover concept and processes for understanding topics such as categorization, stereotyping, prejudice, and social stigma. This course is designed to be an active learning experience, providing students an opportunity to identify and reflect on their own cultures, values and preferences, and how this impacts their individual sphere of influence and the various contexts in which they interface.

 Requisites: PY151 recommended, but not required.

 Current Readings in Animal Behavior
 [Cross-listed with BY 319] The field of animal behavior is a rapidly advancing one, especially at the interface of neurobiology and cognition, and the interface of cognition and functional analysis of behavior (behavioral ecology and sociobiology). This one credit hour course is designed as a 'journal club' with a focus on the latest developments in theory and empirical research on animal behavior. The course is intended for any student who has a sincere interest in integrative animal behavior.

Course Catalog

Run Date: 06/27/2022 Run Time: 14:02:09

PY 360(3)	Course ID:009491 2015-02-20
Learning and Memory	
explored in humans a represented, stored education and in cli	, major theories, and practical applications of learning and memory processes will be nd animals. Topics will include how knowledge is acquired (learning), how it is and accessed (memory), and how these learning and memory principles can be applied in nical settings. The course will take a multidisciplinary approach that will allow ses underlying learning and memory at the behavioral, cognitive, neurobiological, and

2015-01-21 PY 461(3) Course ID:011656 Judgment and Decision Making Decision making is using information (and in some cases, emotion) to guide behavior among multiple possible courses of action - which foods to choose, who to select for a romantic partner, or which products to buy. These choices determine our success in meeting the challenges of life. This course will cover a wide variety of topics regarding how people form judgments and make decisions by drawing on findings from psychology, economics, and biology. We will investigate the various techniques used to study and assess human judgment and decision making, explore how people reason under risk and uncertainty and apply the research addressed in class to real-world problems and issues. Components: Lecture Attributes: Offered Spring Term Requirement Group: Prerequisites: PY 151 and Junior or Senior standing Req. Clinical Psychology

This course is designed to introduce students to the theoretical, empirical, and ethical foundations of clinical psychology. We will focus on the major roles of clinical psychologists, particularly psychotherapy, assessment, and issues in education and training. Students will also be asked to engage in self-reflection throughout the course, as the ongoing development of self-awareness and self-knowledge are essential to effective and ethical practice. Contemporary issues and controversies that are currently shaping the field of clinical psychology will also be addressed. Prior enrollment in PY462 (Abnormal Psychology) is recommended.

Commercializing Innovation

Global Business Strategies

This course focuses on how to successfully commercialize an innovation. While it is important to come up with an innovative idea and develop a product concept, it is equally critical to effectively design and launch the product in the market and ensure its long-term success. This is where the innovation efforts of a large number of entrepreneurs and companies fail. The course provides an exposure to various product design approaches and strategies. Understanding commercialization activities such as pre-product launch planning, market testing, actual product launch, and post-launch follow-up is a major part of the course. These commercialization activities among other things involve developing a marketing plan for the product, carefully testing the plan, modifying the plan based on test market results, and crafting a long-term strategy for the product. The course also provides an exposure to how market data is generated and analyzed during these activities.

Innovation and Entrepreneurship Strategy

SB 440(3)

2015-01-21

The employment of comprehensive case problems in the formulation of action programs and business policy is a major feature in this integrated course in innovation and entrepreneurship strategy. As a capstone course, it is designed to allow students to apply their knowledge in a complex case analysis environment. The hallmark of the course is the application of learned material to realistic, multifarious management issues. Thus, each case represents a complex web of managerial issues that must be resolved. The cases will cover many different content subjects that may vary from semester to semester. The course will also focus on the process of critical thinking in the context of management decision making.

SB 610(3) Course ID:011255 2017-07-14 Corporate Ethical and Social Responsibility

[Cross-listed with SB 609] The central goal of the course is to give students an intellectual foundation to frame a wide range of ethical/moral issues/dilemmas facing contemporary business organizations operating within a global environment. As the business environment grows increasingly complex, managers are confronted with important questions that have ethical ramifications. These questions include: Does a company have any obligation to help solve social problems such as poverty, corruption, pollution, unemployment, and income inequality? What are the ethical responsibilities of a multinational corporation operating in foreign countries, especially those characterized as corrupt? What obligation does a manufacturer have to the consumer with respect to product defects and safety? A wide selection of case studies provides students with the opportunity to hone their skills for applying ethical principles and decision making approaches to address complex, 'real-world' business problems within the context of an evolving political, economic,

Supply Chain Ethics The main goal of this course is to give students an intellectual foundation to analyze and evaluate a variety of ethical issues involved in designing and implementing global supply chain systems. The course equips students with the knowledge and tools for identifying ethical dilemmas, discerning issues, and developing options for resolving those issues in order to build and manage socially and ethically responsible supply chain systems that accomplish triple bottom-line performance. Utilizing case studies, readings, and participants' personal experience, this course will outline and apply various concepts and tools to develop and gain moral insights about ethical dilemmas in supply chain systems (including sourcing/purchasing, customer-supplier relationship management, relational governance, labor relations, and stakeholder management). A wide selection of case studies provide students the opportunity to hone their skills for applying ethical principles and decision making approaches to address complex, "real-world" supply-chain

Entrepreneurship and New Venture Creation

2015-01-21

In this course, students will execute the 'entrepreneurial process,' a sequence of activities related to the creation of a new business venture. As such, this course is intended for students whose personal and near-term objectives involve entrepreneurship. The major components of the entrepreneurial process include idea creation and opportunity assessment, industry research and analysis, strategic and operational planning, and resource mobilization and implementation. These process components will be discussed and implemented throughout the semester; as such, this course is very experiential in nature. Fulfillment of these activities will include extensive out-of-class research, in-class peer reviews and brainstorming sessions, and the development of formal business plan proposals. Students are required to sign non-disclosure agreements, and may elect to present their finished proposals to a panel of small business executives for review. Prerequisite: consent of the instructor.

Building and Managing	g Effective Teams					
In today's global workforce and "gig economy," it is imperative that managers continually identify, organize, lead and assess the "intellectual capital" available for either short or long-term team commitments. The skillset needed to lead teams varies, depending upon organizational strengths and weaknesses. However, specific and agreed upon management behaviors assist managers in leading today's diversified teams toward						
attaining - and exceeding - corporate goals. This course provides an examination of several important management KSA's (Knowledge, Skills, and Abilities) for those responsible for team development and direction.

gap"" refers to the hard-to-navigate space between invention and innovation/commercialization. The course examines successful and unsuccessful ""bridging the gap"" practices across a range of industries, including communicating and translating inventions to diverse stakeholders, engaging stakeholders, gaining commitment, resourcing, and managing gaps over time and across different settings (e.g., solo startups, not-for-profits, and corporate environments). Students will become more adept at managing the various stakeholders and processes within a given invention-innovation space, and at choosing between bridging strategies for different settings. The course uses a studio-based, make-to-learn pedagogy, where learning happens through creative experimentation with live problems.

2016-07-25 SB 662(3) Course ID:012571 International Business [Formerly MBA 662] This course examines international business management as influenced by the important economic, political and cultural environment within which businesses must conduct international trade and investment. The problems and issues confronting international managers are evaluated related to a firm's strategy, organizational structure, manufacturing, material management, marketing, R&D, human resources and finance. Competitive strategies are examined that have been successful in leading international companies. Case studies are used extensively to illustrate the relevance of these topics in the practice of international business. Components: Lecture Attributes: Offered Fall Term Req. Designation: Technology SB 664(3) Course ID:012572 2018-12-06 Entrepreneurship [Formerly MBA 664] The primary objective of this course is to develop an awareness of the process of new

venture creation, whether it is an intrapreneurial or entrepreneurial event. The skills, knowledge and attitudes important for creating new ventures, and the complex tasks faced by individuals who start and manage new and growing businesses as well as corporate ventures and franchises will be addressed. The course is designed to provide a broad overview of management and financial issues. We will pay particular attention to: entrepreneurial decision-making, techniques entrepreneurs and investors use for evaluating and testing the feasibility of business opportunities, understanding the impact of market and industry forces on start up, performance and survival of new ventures, financing a business opportunity, etc.

SB 668(3) MBA Global Study

[Formerly MBA 668] This course includes intensive study of issues in a country or region outside of the United States followed by a one-to-two-week trip abroad to that location. Each section, centered on a unifying theme and geographic location, will include these components: case studies and research work prior to and following the trip, practitioner presentations, in-country university lectures and visits to companies, governmental agencies, and important cultural sites. Students successfully completing this course will gain a better perspective on the economic, political, cultural issues as well as the business practices prevalent in another region of the world. Students should develop cultural awareness, an understanding of economic, cultural, and political differences between the US and other countries, and the role cultural, historical and political factors play in the conduct of business in a global economy.

Growing an Entrepreneurial Business [Formerly MBA 674] This course will focus on the challenges in growing a small to medium size business. The issues facing an entrepreneur when starting a new venture are very different than those he/she faces when growing an existing company or business. The course focuses on the unique issues an entrepreneurial leader faces as he/she looks to grow and scale their business. We will discuss and analyze the issues surrounding effectively scaling a business, and the impact that various decisions and initiatives have on the chance of success. How issues such as strategic marketing, team building and top-grading, financing, partnerships and leadership impact the growing business will be presented and discussed from the perspective of the business leader or entrepreneur. The course will include case studies, lectures, guest speakers, and discussions. Components: Lecture

SC 575(3) Course ID:012834 2021-10-08 Science Demonstrations

Science is more than just a body of knowledge, it is way of thinking and a process to be experienced. Students best learn science by engaging in its practices as they investigate observable phenomena. They must also think deeply about the concepts that cross science disciplines in order to explain those phenomena. This is the premise of the Next Generation Science Standards and the New York State Science Learning Standards modeled from them. Yet many traditional secondary science courses focus mainly on the topics or core ideas without adequately addressing the other dimensions of the course. The design of this 3-credit course is to meet the needs of students currently conducting their internship or anticipating an internship as they prepare to teach three dimensionally. Students will research publications and internet sites in order to compile a usable resource binder of activities that promote a deep understanding of science for themselves and for their adolescent students. The activities they investigate will relate to all conceptual

Liberal Arts - Humanities & Social Sciences - Subject: Social Documentation

SD 200(3) Course ID:011481 2015-03-05 History of Social Documentation

This course will survey the history and ethics of photographic and time-based media in the representation of factual material commonly described as documentary media. From the earliest photographs of battles and other spectacles of the 19th century to the first documentary films of differing cultures of the early 20th century through the socially-charged and the propagandistic photography and films of the Soviet Union, the US Depression, and World War II and onto the networked and interactive social documentaries of today's new media, this course will attempt to define the ever-moving boundaries of terms such as reality, nonfiction, documentary, and social action. Students will study the history of documentary media across cultures, view and analyze notable examples, do research on particular types and movements, present their findings to the class and develop documents that help explain the new, digitally-mediated documentaries. Instructor Consent Required

The course explores social movements in Untied States after World War II and allows students to describe and interpret the complex nature of cultures and societies in historical context. The movements will focus on issues of racial civil rights, workers' rights, the women's movement, the gay rights movement, the American Indian Movement and the Students' Movements. Ranging from 1945 until the present day the course illustrates the process of social, cultural, and geopolitical change over time. This is a team taught course in which students will be required to create a documentary film. Therefore students will split their time between history lectures, seminar style discussion and documentary film production. The course has 3 hours of class and 3 hours of lab per week, and students should expect to do extensive out-of-class work. Limit of 20 students. Permission of one of the instructors required.

Introduction to Society

2(2 - 4)

This course is intended to introduce students to the basic principles, concepts, and perspectives used as 'tools' in sociology to develop a more scientific approach to understanding human society. Major theoretical perspectives and concepts are presented, including sociological imagination, culture, social inequality, social change, and social structure. Students also explore the influence of social class and social institutions, such as churches, education, healthcare, government, economy, and environment. The family as a social structure is also examined. Students will investigate the origin and design of political, economic and social institutions, such as religion, the family, class and caste, education, urban and rural life styles, values, norms, roles, and sociocultural change. Students will learn to analyze, evaluate and critique social structures.

2022-02-11

Sociology of the Family This course will provide an opportunity to look at something familiar (the family) in a new way. We will focus on the family as a social institution-a set of structured social arrangements for meeting certain human needs-and we will examine the larger social forces that shape those structures. We will use a comparative approach to families, emphasizing their diversity both across time and space and within present-day U.S. society- paying particular attention to how social inequality shapes family experiences. By the end of the semester, you should be able to place your own personal experience of families in a larger social, cultural, and historical context

STUDENT LEARNING OUTCOMES: 1. Understand the causes of social inequities in family experiences. Students will learn how systems of privilege organized around gender, race, class, and sexual orientation structure family life. 2. Think critically about how family shapes social life at both individual and structural levels. 3.

School of Arts and Sciences - Humanities & Social Sciences - Subject: Sociology

2022-02-11 SOC 310(3) Course ID:011755

This course will examine the position of women in the major religious traditions of the world, with a special concentration on Christianity. Historically and cross-culturally women have largely been relegated to the status of the profane and passive other in the domain of the religious. This religious alienation has profound implications not only for the spiritual lives of women but for the personal, social, political, and economic aspects of their existence as well. This course will explore andocentric patterns of domination as they are grounded in and legitimated by religious systems of meaning. We will also explore transformative alternatives that exit within the worlds' religious traditions themselves in an effort to identify sources of empowerment, mutuality and justice for women and men.

Medical Sociology

SOC 320(3)

SOC 330(3)

This course provides an introduction to the sociological study of health and the institution of medicine. This includes exploring questions such as: How is social inequality connected to our health? Is healthcare enough to remedy any health inequalities that might exist? Why is it that so many things are being classified as diseases these days, when we used to just think of them as eccentricities? Nowadays, people often think of themselves as customers as well as patients- how is this change related to broader social changes about the role of medicine? Through this course, you will develop a strong understanding of the contributions that sociology has made to the study of health and illness, as well as a mature perspective on many of our society's pressing health issues.

NOTE: SOC201 (intro	to society) or pre-health focus are recommended, but not required.

Course ID:013055 2022-02-11 Global Advocacy for Women's Sexual Reproductive Health & Rights

[Cross Listed as SOC540] Women are not waiting to be saved or 'given their rights.' They act on their own behalf, and advocate for others. In many cases, women-led movement. Victory is denied, delayed, or arrives disquised in unexpected packages. This course will examine advocacy for women's sexual and reproductive health and rights (SRHR). Students will identify, design and implement an advocacy project to address an SRHR concern on campus. Project outcomes will be presented in class.

Institute for STEM Education - CRC Education Program - Subject: Science, Tech, Eng, Math

STEM 330(3) Course ID:012780 2017-07-01 History and Philosophy of Science and Math

This course looks at teaching STEM-related content from historical and philosophical perspectives, as its title suggests. In this course you will not only assimilate the concepts presented but will also evaluate and create instructional strategies and materials that can infuse these concepts into your own secondary courses. This expectation is in many respects more demanding and time-consuming than expecting you to learn an abundance of historical detail and philosophical argument and regurgitate it back on an examination. This course will argue that historical and philosophical content can be used to enhance secondary students' understanding of the STEM concepts and methods they are expected to attain and ask you to develop or restructure lessons and materials to illustrate that enhancement. Ideally, having science, mathematics, and technology students in the course this year will enhance the general knowledge of all participants and help them distinguish between the unique elements of each enterprise.

STEM 501(4) Course ID:012942 2019-05-09 STEM Pedagogy and Professionalism

STEM Pedagogy and Professionalism is designed to help graduate students, particularly graduate TAs, develop the skills necessary to be successful in their graduate programs as instructors and in their future roles as academics. The course will highlight methods for developing and enhancing the pedagogical content knowledge and instructional skill set of graduate STEM teaching assistants. Within the context of STEM learning; audience, environment, nature of science, formative assessment, models of instruction, learning theory, and reflective practice will be studied. A focus on STEM literacy, will help TAs think critically about multiple data sources in order to promote higher-order thinking skills among their students. The course also addresses intercultural communication in the classroom; providing an opportunity for students to improve their cultural and sociolinguistic competence. In particular, students will work on developing their professional communication skill set including oral comprehensibility, impromptu speaking skills and **Components:** Lecture

Course ID:012705 2022-04-08 STEM 530(3) Analyzing Scientific and Math Theories from Philosophical & Historical Perspectives This 3-credit course is neither a history of STEM disciplines course nor a philosophy of STEM disciplines course. Rather, it is a course that looks at teaching STEM-related content from historical and philosophical perspectives, as its title suggests. This is an important distinction for several reasons. First, we believe that you will be best served by an introduction to history and philosophy of STEM disciplines and nature of STEM core concepts which are taught in a manner and at a level that models effective teaching. Modeling the teaching of these concepts in the course will provide you with strategies you might use with your own middle and high school students. Second, we are hoping that you will not only assimilate the concepts presented but will also evaluate and create instructional strategies and materials that can infuse these concepts into your own secondary courses. This expectation is in many respects more demanding and time-consuming than expecting you to learn an abundance of historical detail and philosophical argument and Components: Seminar

TE 515(3) Course ID:013156 2022-03-18 Language and Identity in the Multicultural Classroom

This asynchronous course provides a conceptual framework to examine the roles of language, culture, and identity in the multicultural classroom. We will consider the perception of language as an asset and source of conflict at home, in schools, and across communities. Candidates will study different linguistic and cultural groups representative of those across NYS, paying particular attention to attributes of collectivistic cultures that inform teaching within the local context. Additionally, we will explore classroom dynamics in a multilingual environment, including the intersectionality of race, gender, socioeconomics, and immigrant status. Candidates will develop a deeper understanding of sociolinguistic factors that contribute to a culturally responsive classroom that yields equitable achievement outcomes for linguistically diverse students. (15 hours field work required)

Graduate Interdisciplinary - CRC Education Program - Subject: Teaching English

TE 519(3) Course ID:013157 2022-03-18 Methods and Materials for Bilingual Instruction and Assessment

Course ID:013158

This asynchronous course prepares candidates to teach and assess literacy in students' home and new languages. We will approach biliteracy and translanguaging practices with the view of language as an asset, and we will analyze and evaluate course content through a lens of equity. Specifically, we will explore effective methods of instruction and assessment of ELLs' skills in English and their native language in the bilingual classroom. As we discuss theories and components of reading, candidates will deepen their knowledge of reading processes in learners' first and new languages.

Through a comparative analysis of English and the native language, we will survey and evaluate texts and instructional materials to promote native language literacy development. As we consider strategies and tools for instruction and assessment, candidates will create an annotated bibliography of resources to support native language arts and bilingual instruction. Additionally, candidates will create a series of

Teaching Content in a Bilingual Context

2022-03-18

The asynchronous course explores the role of academic language across the curriculum and the power of the native language in the bilingual classroom to increase access to grade-level content for English language learners. Through text, discussion, observation, and application, we will identify opportunities to leverage the role of ELLs' native languages to promote transfer of knowledge and skills while increasing students' membership and agency in the classroom. As we study and apply the principles of content-based instruction for ELLs, we will consider effective strategies and practical techniques for assessment in core curricular areas. Guided by the NYSED Culturally Responsive Sustaining Framework, we will approach this work with a shared vision of yielding equitable academic outcomes for ELLs.

Throughout the course, candidates will describe and evaluate culturally responsive pedagogy and materials to advance ELLs' content knowledge while differentiating instruction and assessment for diverse learners. The

TESOL English Linguistics

English Linguistics is an introduction to linguistics for Teachers of English to Speakers of Other Languages. It presupposes little or no formal linguistic knowledge. We will study the rudiments of phonetics, phonology, syntax, morphology, semantics, sociolinguistics and language acquisition. We will study linguistics both as an end in itself and as it informs classroom teaching. This course will prepare students to teach English as a New/Second Language, with a firm knowledge of the linguistic challenges English presents to language learners. Discussions and connections between theory and practice are a significant component of this course. Seminar

teaching. In an intensive 6 week online format, students will be immersed in activities to create a strong foundation of knowledge on language development, standards and policy, and pedagogy. We will examine key aspects of historical and current theories of second language acquisition, as well as methods of instruction and assessment in SL education. Language modalities, language functions, content and context-based instruction will be introduced. This course is based on a view of teaching and learning as facilitated by social interaction in which each individual brings unique background knowledge and beliefs to their learning. It is expected that students will make connections between the readings and learning activities of the

TESOL Literacy introduces students to issues in reading, writing and new literacies for students who are learning a new or second language. We will review current instructional practices in light of theoretical foundations, educational policy, and culture forces that shape acquisition and development of a new/second language. In addition, we will dissect practical strategies for teaching English language learners. Your understanding of course ideas and issues will be assessed frequently through a variety of on-line discussions, assignments, activities, and a final project. This course includes 20 hours of required field experience.

TESOL Teaching Residency I

The 5-credit Residency I begins after the resident completes the New York State required Field Practicum, TE 501, during the summer semester. The Resident will first observe and co-teach with his/her Mentor at the beginning of the school year. The Resident is expected to gradually assume responsibility for two of the mentor's classes, at first co-teaching with the Mentor, but independently teaching within 5 weeks, if prepared to do so. After successful completion of the first teaching residency in the fall (either K-6 or 7-12), the Resident will complete a second residency in the spring semester to fulfill the K- 12 residency requirement. A full-year intern is in school for a minimum of half of the school day. Which half of the day depends on the schedule assigned to the Mentor by the school district. During the spring semester, the resident will complete the requirements of edTPA.

This course is open only to students matriculated in the Master of Arts in Teaching ESOL program who have been initially certified as teachers in NYS.

The 5-credit residency begins after the resident student completes the New York State required Field Practicum, TE 501. The resident will first observe and co-teach with his/her mentor teacher. The resident is expected to gradually assume responsibility for some of the mentor's classes, at first co-teaching with the mentor, and then independently teaching when prepared to do so. After successful completion of the first teaching residency (TE 553), the resident will complete a second residency (TE 554). Students will complete a minimum of 20 full days at the elementary level and 20 full days at the secondary level to reflect the NYS requirement.

TESOL Project

The TESOL Project is a one semester, online research project class whose purpose is to allow students time and supervision to develop breadth and/or depth of knowledge to become a better teacher in the field of TESOL. What the project will entail varies greatly from student to student. The course is intended to be custom-tailored to meet the specific needs of an individual intern and their teaching setting. TESOL projects are well-grounded in research and theory, but also include a strong and extensive applied aspect, directly addressing the question: What would this look like in the classroom?

maximize academic, professional and personal success. By exploring the areas of physical, financial, spiritual, professional, and emotional wellness, students will begin to develop an individualized definition of success. Students will learn about creating a work-life balance as their academic career becomes more rigorous with the goal of becoming better prepared for their professional job search, make confident academic major choices, and develop a greater understanding of post-graduate career options. Students will be encouraged to engage in decision making regarding curricular and co-curricular experiences from a wellness perspective. The course is a collaborative effort across multiple Clarkson University departments designed to provide a supportive mechanism., in addition to academic advising, for further soft-skill development and resilience habits.
